

SOA using Open ESB, BPEL, and NetBeans

Sang Shin

Java Technology Evangelist

Sun Microsystems, Inc.

Three Talks I Did on SOA Here

- NetBeans Day: “Tools for Simplifying SOA”
 - > Focus is to show how to use NetBeans for building a simple Composite application
- GlassFish Day: “Open ESB and GlassFish”
 - > Focus is to show more advanced features such as Intelligent Event Processing module for building a composite application
- Sun Tech Day: “SOA using Open ESB, BPEL, and NetBeans”
 - > Focus is to explain how WSDL, BPEL, JBI, Open ESB, Java EE work together

Agenda

- Composite Applications
- BPEL
- Services
- JBI
- Java EE Service Engine
- Open ESB
- Open ESB runtime, tools, and sample apps
- Demo

Composite Applications

Traditional Application Development

- Point technologies, products, and APIs
 - > For example: EJB, Spring, Hibernate, JSF, Servlets, Struts, etc.
- Lots of glue written by developers
 - > Requires a great deal of expertise & time
 - > Inflexible

Composite Applications

- A way to compose applications from reusable parts
- Composite applications employ SOA principles
 - > Features exposed as Web services
 - > Standards-based interaction between services
 - > Are themselves composable

WSDL Tutorial (Optional Presentation)

Why WSDL?

- Enables **automation** of communication details between communicating partners
 - Machines can read WSDL
 - Machines can invoke a service defined in WSDL
- Discoverable through registry
- Arbitration
 - 3rd party can verify if communication conforms to WSDL

WSDL Document Example

- Simple service providing stock quotes
- A single operation called `GetLastTradePrice`
- Deployed using `SOAP 1.1 over HTTP`
- Request takes a ticker symbol of type `string`
- Response returns price as a `float`

WSDL Elements

- Types
- Message
- Operation
- Port Type
- Binding
- Port
- Service

WSDL Elements

- Types
 - Data type definitions
 - Used to describe exchanged messages
 - Uses W3C XML Schema as canonical type system

WSDL Example: Types

```
<definitions name="StockQuote"
  targetNamespace="http://example.com/stockquote.wsdl"
  xmlns:tns="http://example.com/stockquote.wsdl"
  xmlns:xsd="http://example.com/stockquote.xsd"
  xmlns:soap="http://schemas.xmlsoap.org/wsdl/soap/"
  xmlns="http://schemas.xmlsoap.org/wsdl/">
  <types>
    <schema targetNamespace="http://example.com/stockquote.xsd"
      xmlns="http://www.w3.org/2000/10/XMLSchema">
      <element name="TradePriceRequest">
        <complexType>
          <all>
            <element name="tickerSymbol" type="string"/>
          </all>
        </complexType>
      </element>
      <element name="TradePrice">
        <complexType>
          <all>
            <element name="price" type="float"/>
          </all>
        </complexType>
      </element>
    </schema>
  </types>
```

WSDL Elements

- Messages
 - **Abstract**, typed definitions of **data** being exchanged
- Operations
 - **Abstract** description of an **action**
 - Refers to an **input** and/or **output messages**
- Port type
 - **Collection** of operations
 - **Abstract definition** of a service

Example:

Messages, Operation, Port type

```
<message name="GetLastTradePriceInput">  
  <part name="body" element="xsd1:TradePriceRequest"/>  
</message>
```

```
<message name="GetLastTradePriceOutput">  
  <part name="body" element="xsd1:TradePrice"/>  
</message>
```

```
<portType name="StockQuotePortType">  
  <operation name="GetLastTradePrice">  
    <input message="tns:GetLastTradePriceInput"/>  
    <output message="tns:GetLastTradePriceOutput"/>  
  </operation>  
  <!-- More operations -->  
</portType>
```

WSDL Elements

- Binding
 - Concrete protocol and data format (encoding) for a particular Port type
 - Protocol examples: SOAP 1.1 over HTTP or SOAP 1.1 over SMTP
 - Encoding examples: SOAP encoding, RDF encoding
- Port
 - Defines a single communication endpoint
 - Endpoint address for binding
 - URL for HTTP, email address for SMTP
- Service
 - Aggregate set of related ports

Example: Binding, Port, Service

```
<binding name="StockQuoteSoapBinding" type="tns:StockQuotePortType">
  <soap:binding style="document"
    transport="http://schemas.xmlsoap.org/soap/http"/>
  <operation name="GetLastTradePrice">
    <soap:operation
      soapAction="http://example.com/GetLastTradePrice"/>
    <input> <soap:body use="literal" />
    </input>
    <output> <soap:body use="literal" />
    </output>
  </operation>
</binding>

<service name="StockQuoteService">
  <documentation>My first service</documentation>
  <port name="StockQuotePort" binding="tns:StockQuoteSoapBinding">
    <soap:address location="http://example.com/stockquote"/>
  </port>
</service>
```

BPEL

Need for Business Process

- Developing the web services and exposing the functionality (via WSDL) is not sufficient
- Example Scenario
 - > Concert ticket purchase Web service has 3 operations, which need to be performed in the following order
 - > Getting a price quote
 - > Purchase a ticket
 - > Confirmation and cancellation
- We also need a way to orchestrate these functionality in the right order

BPEL Works With WSDL

- Web services are described in WSDL
- We need a way to orchestrate these operations with multiple web services in the right order to perform a Business process
 - > Sequencing, conditional behavior etc.
- BPEL provides standard-based orchestration of these operations

BPEL: Relationship to Partners

Business Process Needs To...

- Co-ordinate asynchronous communication between services
- Correlate message exchanges between parties
- Implement parallel processing of activities
- Implement compensation logic (Undo operations)
- Manipulate/transform data between partner interactions
- Support for long running business transactions and activities
- Handle exception handling
- Need for universal data model for message exchange

What is BPEL?

- XML-based language used to specify business processes based on Web Services
- BPEL processes describe
 - > Long running, stateful, transactional, conversations between two or more partner web services
- BPEL is key to implementing SOA
 - > Conversational
 - > Mostly Async
 - > XML Document-based
 - > Orchestrated

BPEL Document Structure

<process>

<!-- Definition and roles of process participants -->

<partnerLinks> ... </partnerLinks>

<!-- Data/state used within the process -->

<variables> ... </variables>

<!-- Properties that enable conversations -->

<correlationSets> ... </correlationSets>

<!-- Exception handling -->

<faultHandlers> ... </faultHandlers>

<!-- Error recovery - undoing actions -->

<compensationHandlers> ... </compensationHandlers>

<!-- Concurrent events with process itself -->

<eventHandlers> ... </eventHandlers>

<!-- Business process flow -->

(activities)*

</process>

BPEL Activities

Basic Activities

- `<invoke>`
- `<receive>`
- `<reply>`
- `<assign>`
- `<throw>`
- `<wait>`
- `<empty>`
- `<exit>`

Structured Activities

- `<if>`
- `<while>`
- `<repeatUntil>`
- `<foreach>`
- `<pick>`
- `<flow>`
- `<sequence>`
- `<scope>`

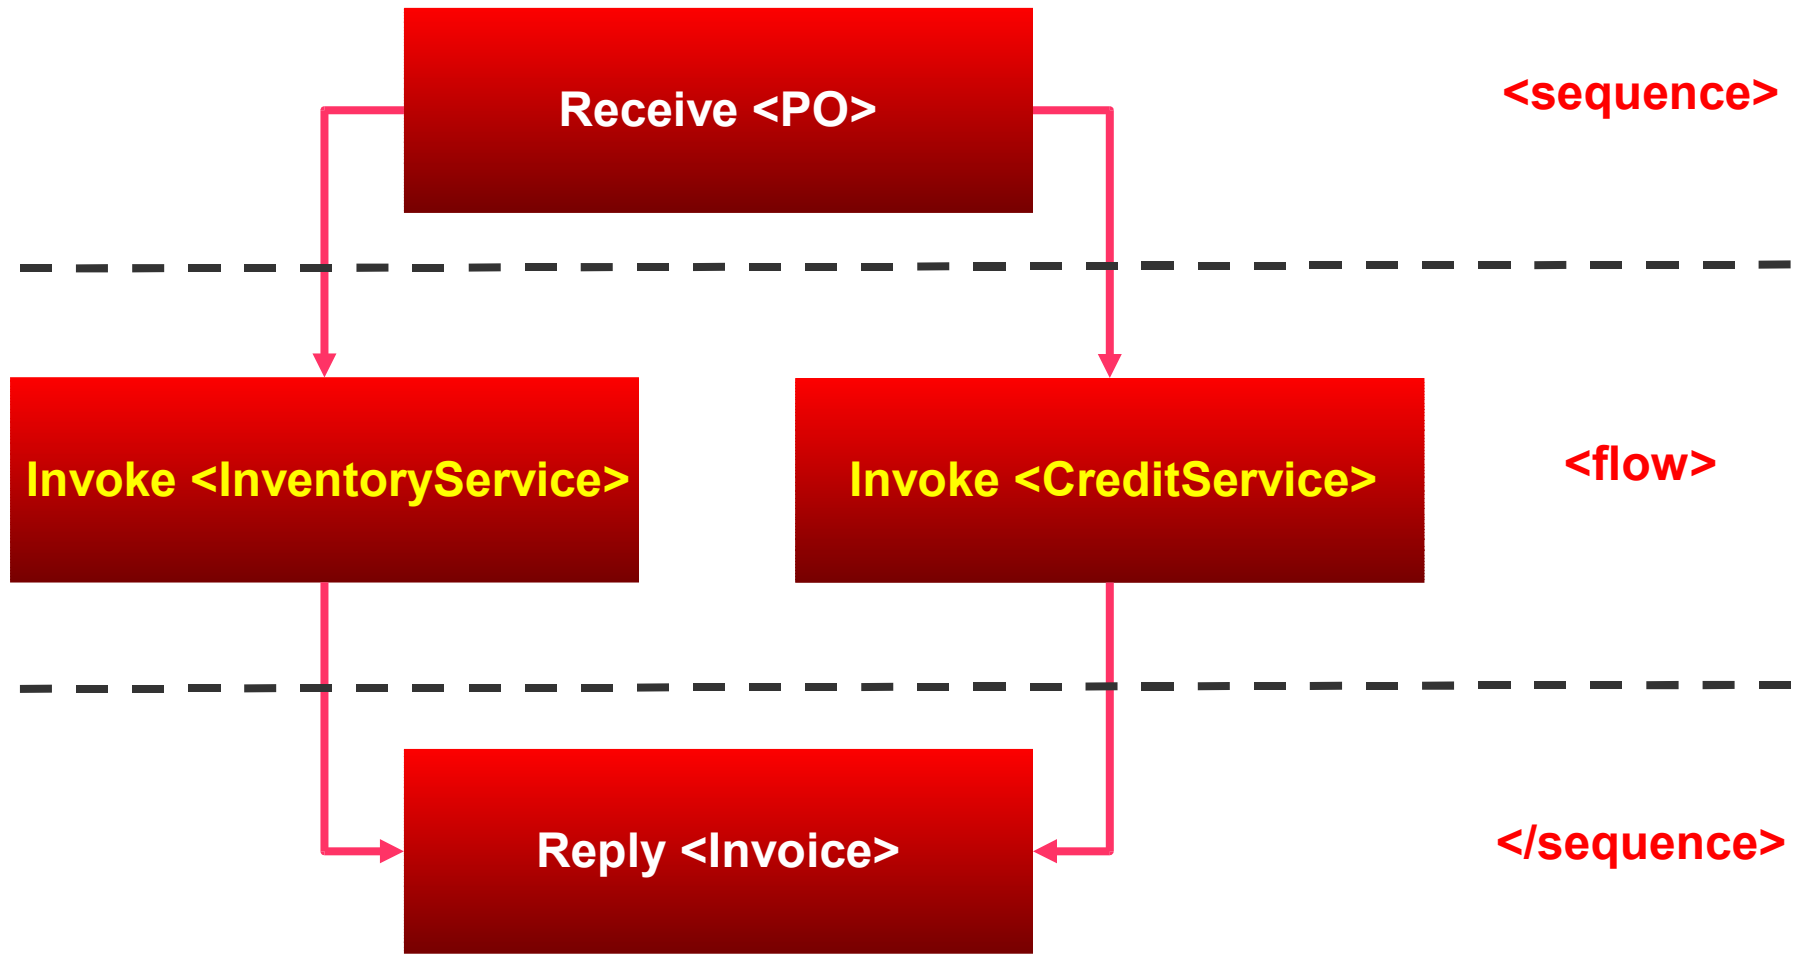

BPEL: Basic Activities

- **<invoke>**
 - > To invoke a one-way or request/response operation on a portType offered by a partner
- **<receive>**
 - > To do a blocking wait for a matching message to arrive
 - > Can be the **instantiator of the business process**
- **<reply>**
 - > To send a message in reply to a message that was received through a <receive>
 - > The combination of a <receive> and a <reply> forms a request-response operation on the WSDL portType for the process

BPEL: Structured Activities

- **<sequence>**
 - > Perform activities in sequential order
- **<flow>**
 - > Perform activities in parallel
- **<if>**
 - > Conditional choice of activities
- **<scope>**
 - > Enclose multiple activities in a single scope

Example Business Process

Sample Activities in BPEL

```
<sequence>
  <receive partnerLink="customer" portType="lns:purchaseOrderPT"
    operation="sendPurchaseOrder" variable="PO"
    createInstance="yes" />

  <flow>
    <invoke partnerLink="inventoryChecker" portType="lns:inventoryPT"
      operation="checkINV" inputVariable="inventoryRequest"
      outputVariable="inventoryResponse" />

    <invoke partnerLink="creditChecker" portType="lns:creditPT"
      operation="checkCRED" inputVariable="creditRequest"
      outputVariable="creditResponse" />
  </flow>
  ...
  <reply partnerLink="customer" portType="lns:purchaseOrderPT"
    operation="sendPurchaseOrder" variable="invoice"/>
</sequence>
```

BPEL: Relationship to Partners

Why Do You Care on BPEL?

- In SOA-enabled environment, you are more likely to build an application by orchestration various services via BPEL
- You will probably use BPEL design tool to create a BPEL document
- The BPEL document is then executed by BPEL engine
 - > Highly likely in JBI enabled platform

Demo:

**Building and Running
Travel Reservation
Composite Application
through BPEL**

Demo Scenario: Travel Reservation Business Process

- It receives travel reservation request from its client
 - > The request contains travel reservation request XML document based on OTA (Open Travel Association)
- It then performs travel reservation business process talking to three partner web services
 - > Airline reservation partner web service
 - > Hotel reservation partner web service
 - > Vehicle reservation partner web service
- The three partner web services are implemented as EJB based web services

Demo Scenario

- You can try this demo yourself
 - > <http://www.netbeans.org/kb/60/ep-understand-trs.html>
- See Travel Reservation business process as a BPEL document
- See WSDL documents of partner web services and of the BPEL process web service
- Build and deploy the application over GlassFish and JBI server
- Test the application with test requests
- Perform source-code debugging on BPEL

Services and SOA

What Are Services?

- Black-box components with well-defined interfaces
 - > Performs some arbitrary function
 - > Can be implemented in myriad ways
- Accessed using XML message exchanges
 - > Using well-known message exchange patterns (MEPs)
- Metadata in the form of WSDL describes...
 - > Abstract interfaces
 - > Concrete endpoints

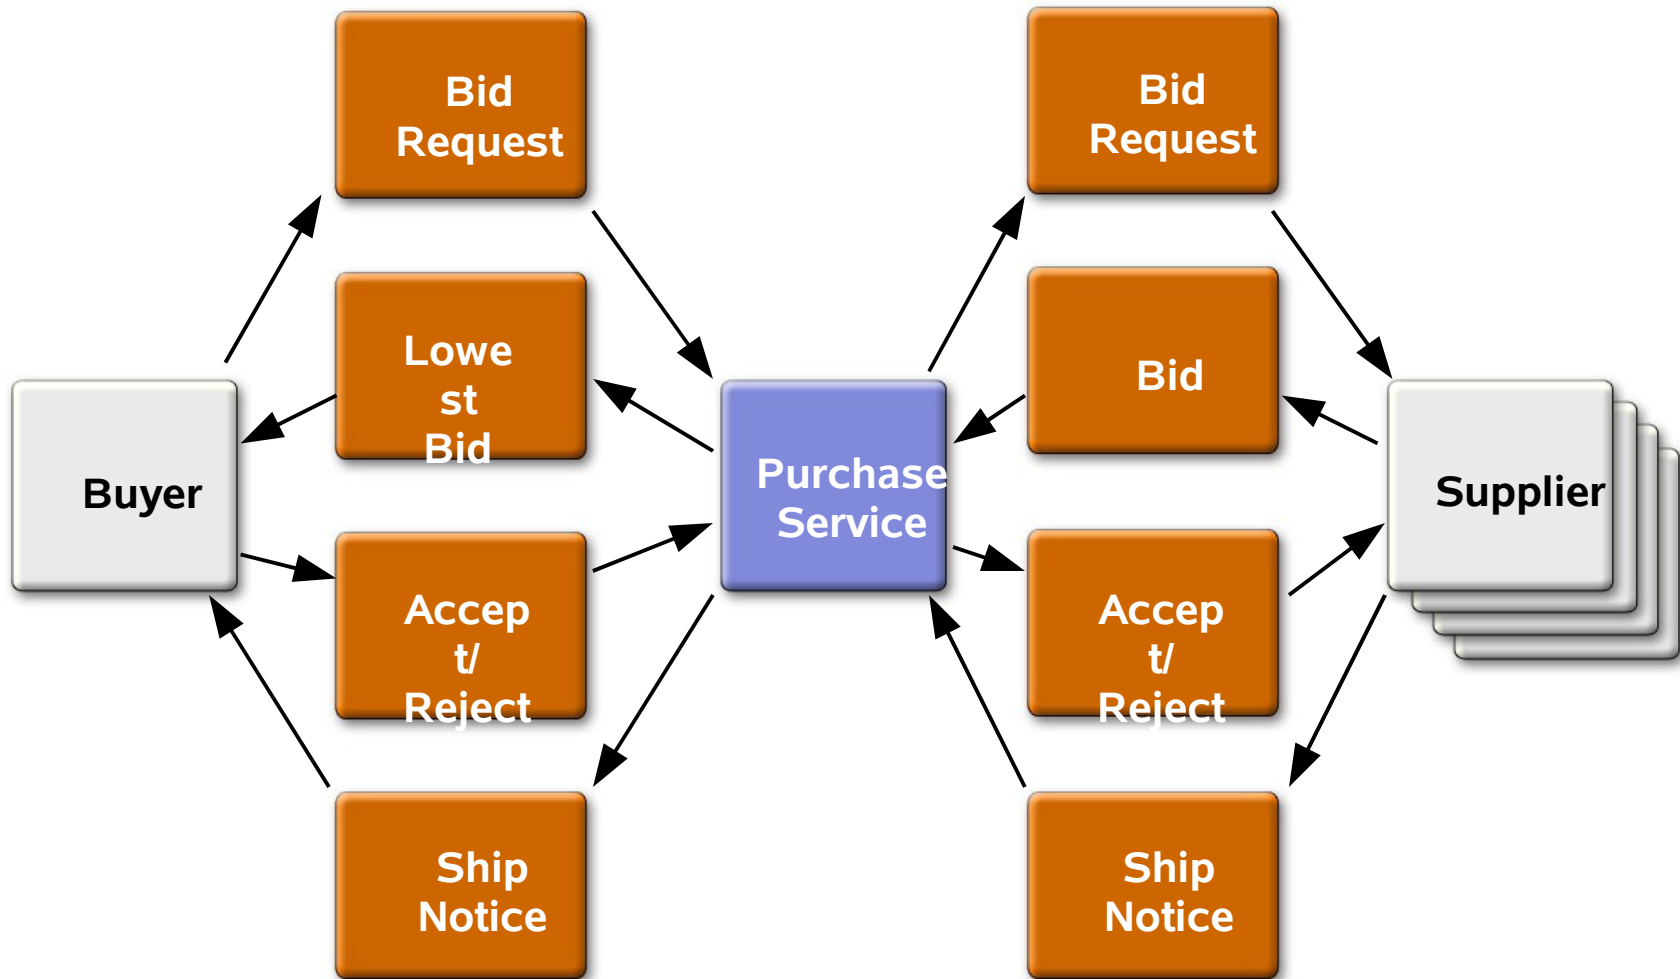

What Can Services Do?

- Perform business logic
- Transform data
- Route messages
- Query databases
- Apply business policy
- Handle business exceptions
- Prepare information for use by a user interface
- Orchestrate conversations between multiple services
- ...

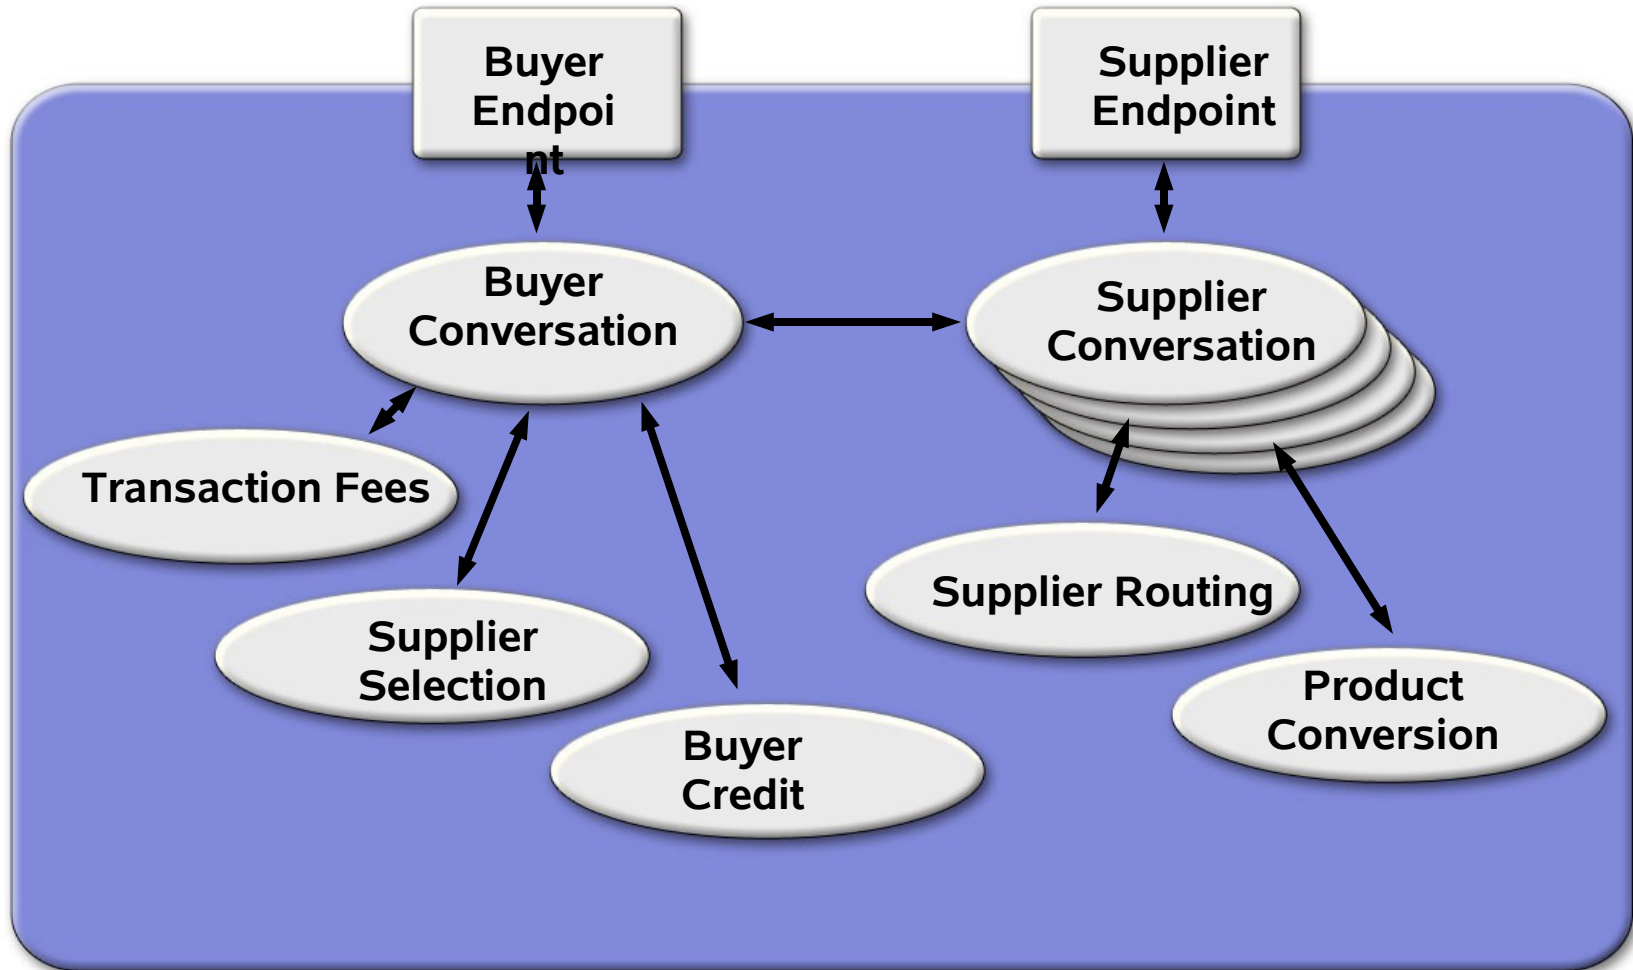

How Are Services Implemented?

- Enterprise JavaBeans[™] (EJB[™]) technology
- BPEL
- XSLT
- SQL
- Business rules
- Mainframe transaction
- EDI transform
- Humans (yes, really!)
- ...

Example: Purchase Service

Purchase Service Functions

Purchase Service Functions

Service Oriented Architecture (SOA)

- An architectural principle for structuring systems into coarse-grained *services*
- Technology-neutral best practice
- Emphasizes the loose coupling of services
- New services are created from existing ones in a synergistic fashion
- Strong service definitions are critical
- Services can be re-composed when business requirements change

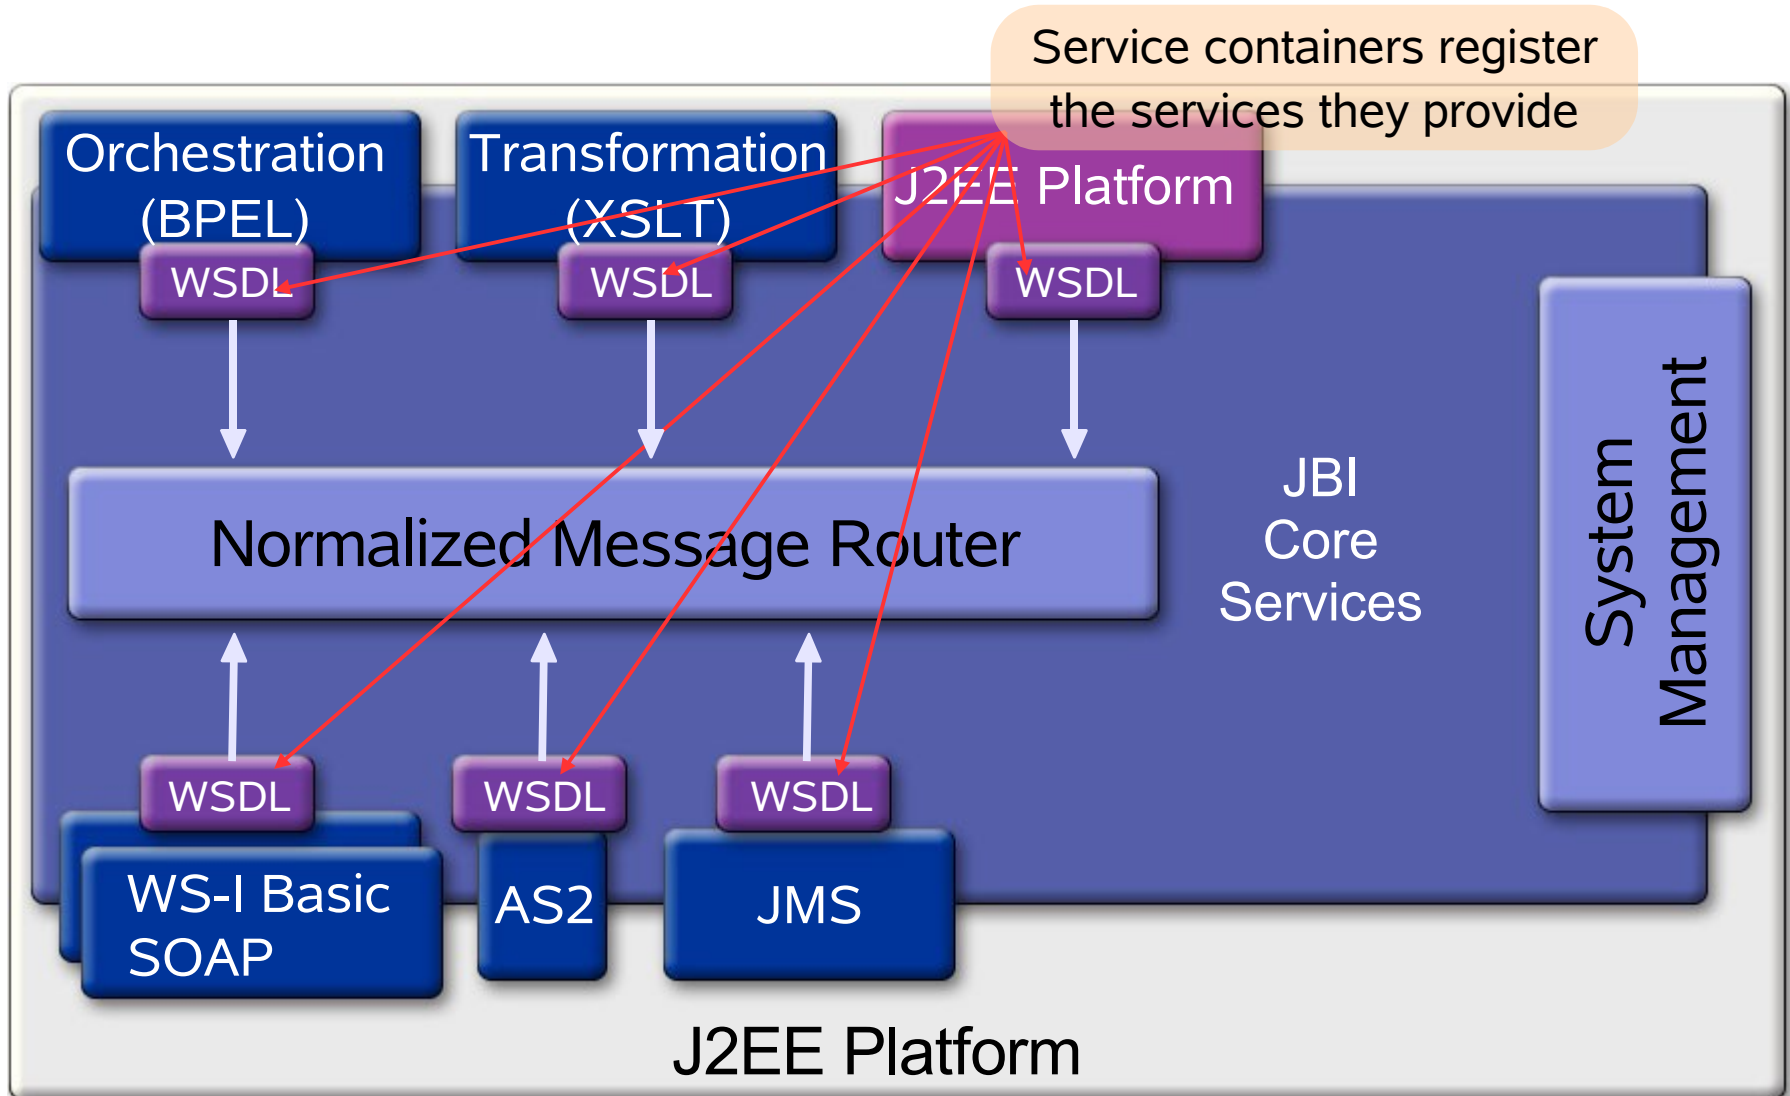

Service Implementation over JBI

What Is JBI?

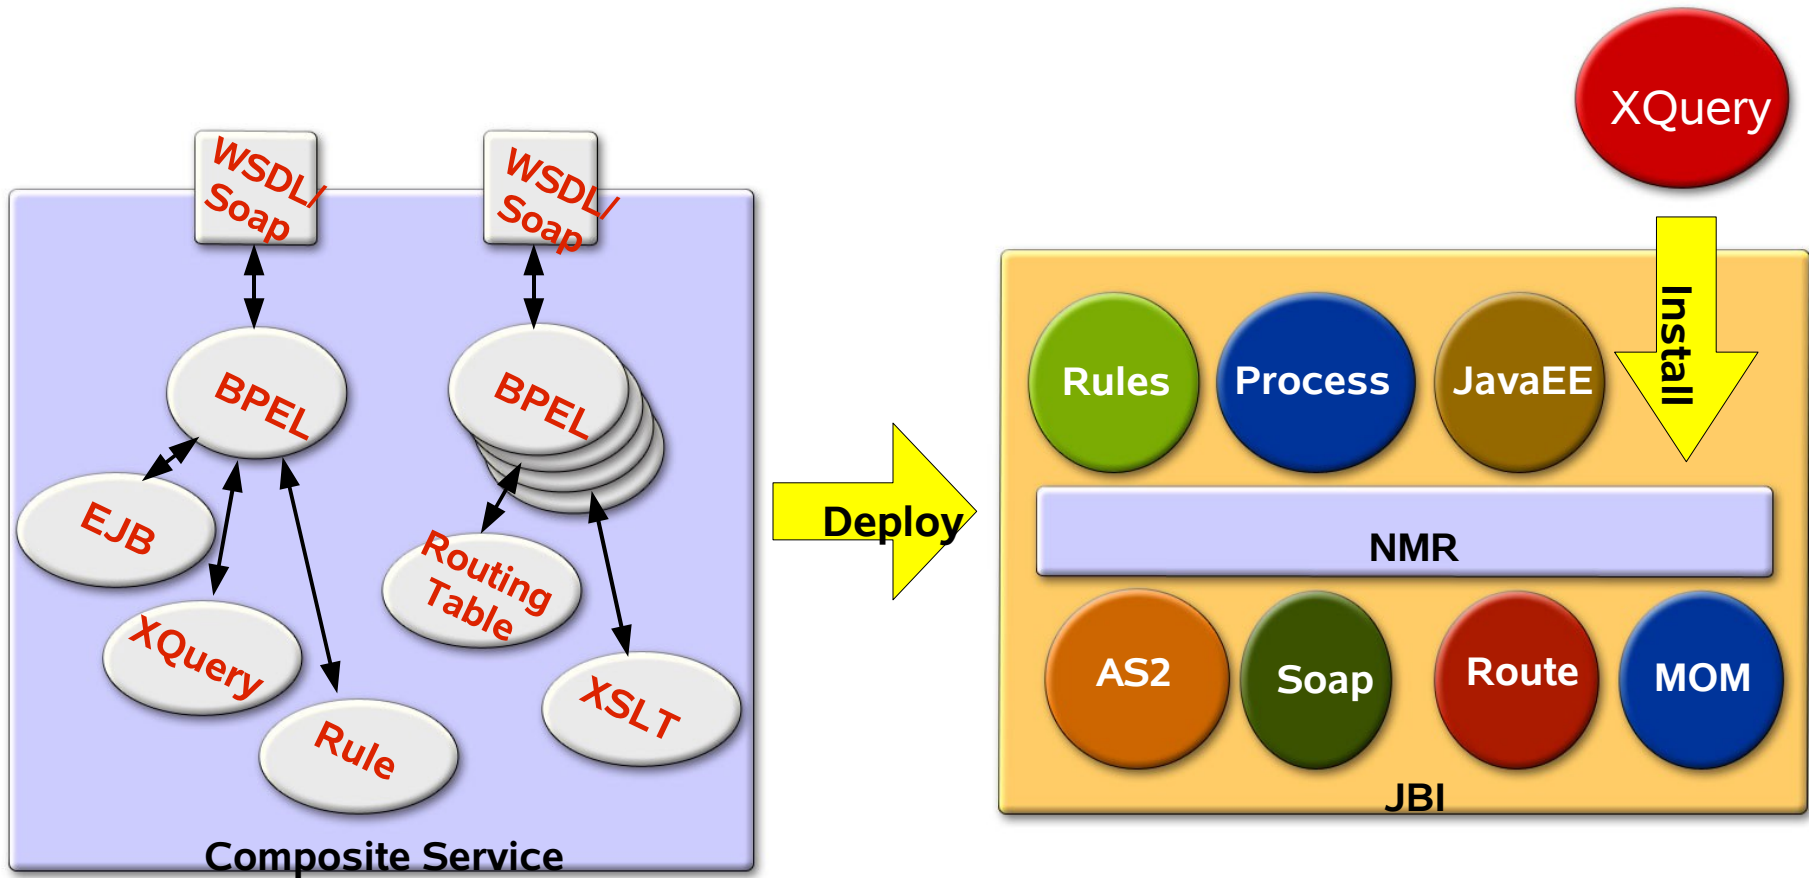

- Standard “meta-container” for integrating “service containers”
 - > Service containers can host any services
 - > Business logic service
 - > System services
 - > Service can be located locally or remotely
- Plug-in architecture
 - > Service Engines (SE) – Local service or consumer
 - > Binding Components – Remote service or consumer

Service Provider Self-Description

Java Business Integration (JSR 208)

Open ESB

What is Open ESB?

- Project Open ESB implements an Enterprise Service Bus (ESB) runtime using Java Business Integration (JBI) as the foundation
 - > This allows easy integration of web services to create loosely coupled enterprise class composite applications.
- It also provides various tools for the development, deployment, and management of composite applications

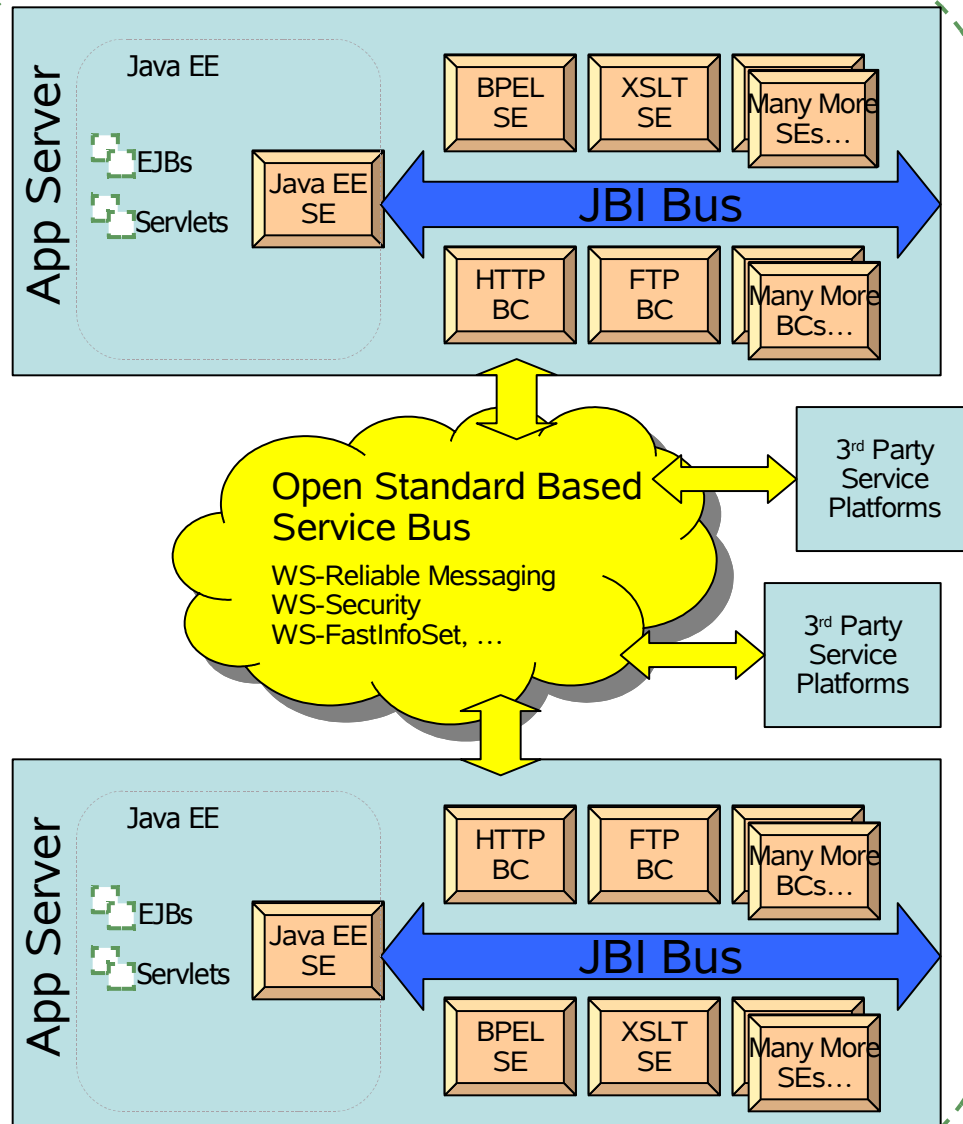

Open ESB Architecture

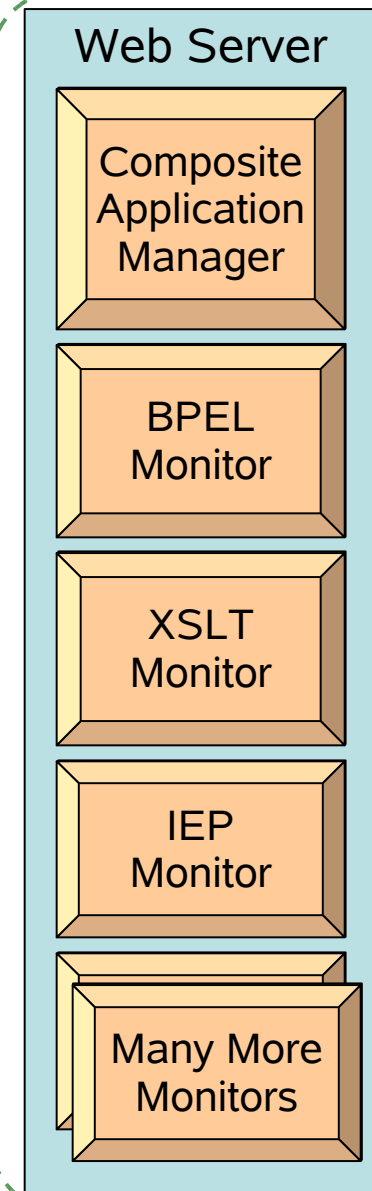

Design-Time

Runtime

Management

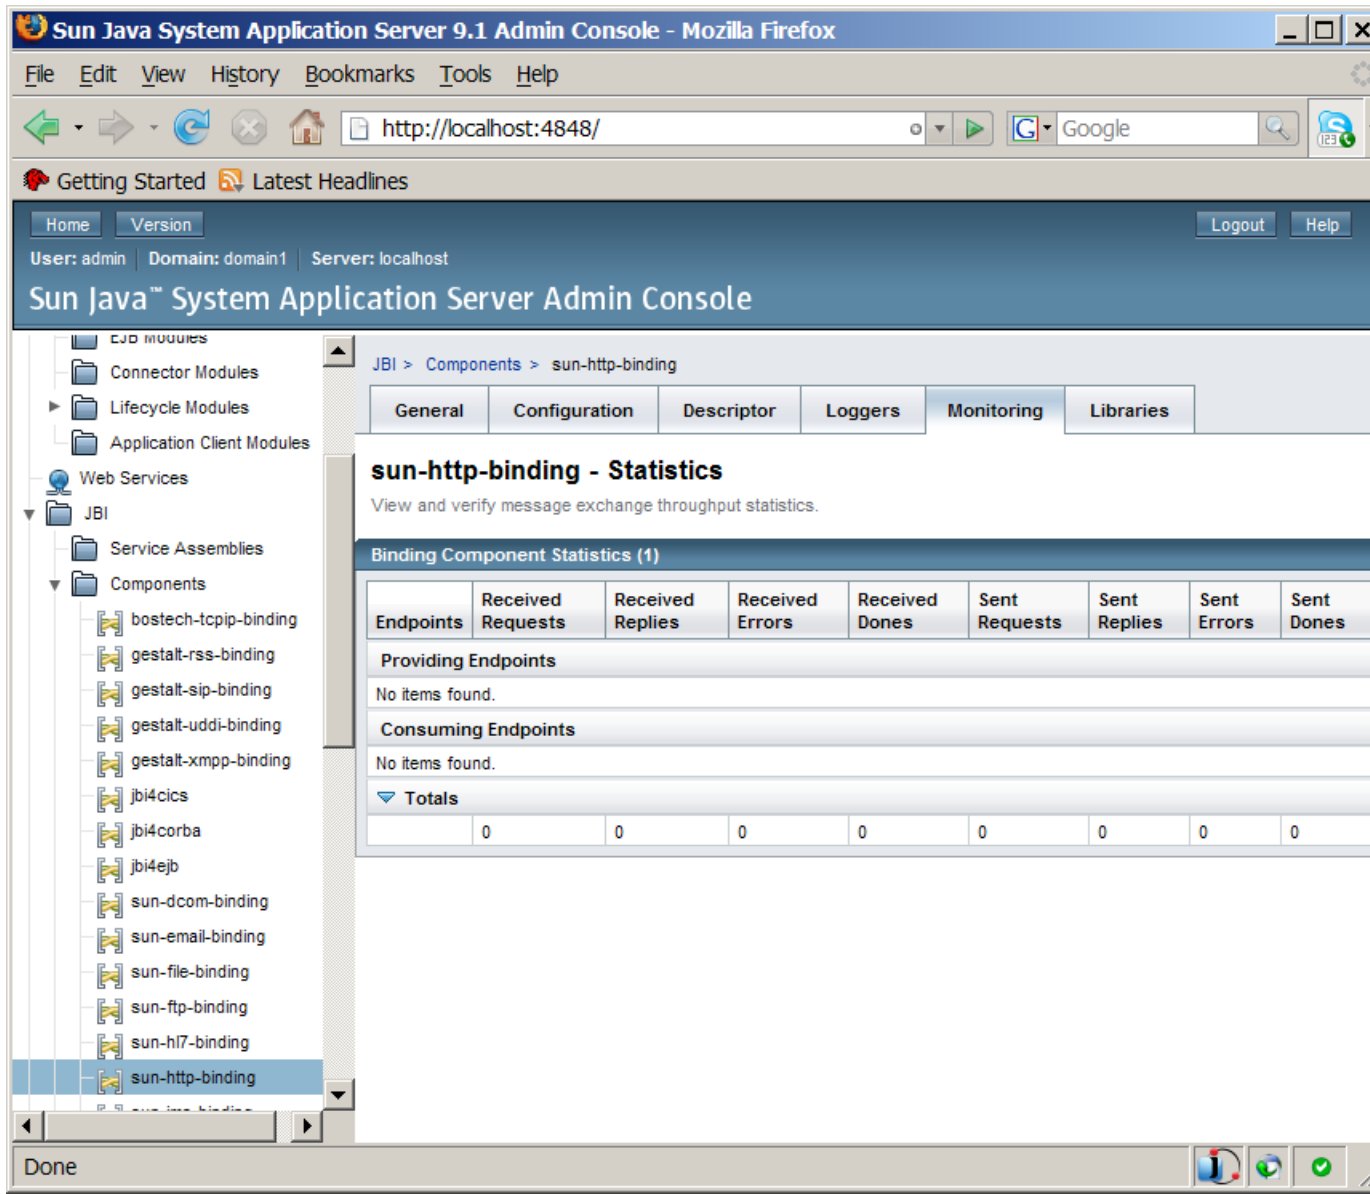

JBI and GlassFish

JB I Support in GlassFish

- A JB I runtime has been integrated with GlassFish V2
- GlassFish admin console now supports JB I
- Java EE Service Engine act as the bridge between Java EE applications and JB I
- A Java EE application archive (ear/war/jar) can be packaged in a JB I composite application
- JB I runtime has been enhanced to adhere to the appserver clustering architecture
 - > Each instance in the appserver cluster will also have a JB I runtime in it

JBI in Admin Console

The screenshot shows the Sun Java System Application Server 9.1 Admin Console in Mozilla Firefox. The browser address bar shows `http://localhost:4848/`. The console interface includes a navigation pane on the left with a tree view showing the hierarchy: **EJB Modules**, **Connector Modules**, **Lifecycle Modules**, **Application Client Modules**, **Web Services**, and **JBI**. Under **JBI**, there are **Service Assemblies** and **Components**. The **Components** list includes `bostech-tcpip-binding`, `gestalt-rss-binding`, `gestalt-sip-binding`, `gestalt-uddi-binding`, `gestalt-xmpp-binding`, `jbi4cics`, `jbi4corba`, `jbi4ejb`, `sun-dcom-binding`, `sun-email-binding`, `sun-file-binding`, `sun-ftp-binding`, `sun-hl7-binding`, and `sun-http-binding` (which is selected).

The main content area displays the **sun-http-binding - Statistics** page. It includes tabs for **General**, **Configuration**, **Descriptor**, **Loggers**, **Monitoring** (selected), and **Libraries**. The page title is **sun-http-binding - Statistics**, and the subtitle is **View and verify message exchange throughput statistics.**

The **Binding Component Statistics (1)** section contains a table with the following data:

Endpoints	Received Requests	Received Replies	Received Errors	Received Dones	Sent Requests	Sent Replies	Sent Errors	Sent Dones
Providing Endpoints								
No items found.								
Consuming Endpoints								
No items found.								
Totals								
	0	0	0	0	0	0	0	0

Usage Scenario

Usage Scenario: Loan Processing

- Loan Requestor Service:
 - > LoanRequestProcess
 - > WS-I BP
 - > BPEL Orchestration
 - > LoanProcessor
 - > JavaEE
 - > TransformReport
 - > XSLT
 - > LoanReportStore
 - > Business Partner thru FTP
 - > LoanReportMailer
 - > Legacy thru JMS

Open ESB Components

The following list of components are currently available at the Open JBI Components project. In this page you can find a component by their function, their solution or by their name. Clicking on a component link will provide details on how they are built, what their current capabilities are and the future plans around these components.

NetBeans Support of Open ESB

Types of SOA “NetBeans” Projects

- When creating a composite application, you typically use the following types of SOA “NetBeans” projects:
 - > BPEL Module project (NetBeans 6.0)
 - > XSLT Module project (NetBeans 6.0)
 - > SQL Module project (NetBeans 6.0)
 - > Composite Application project (NetBeans 6.0)
 - > IEP Module project (OpenESB package)
 - > Worklist Module project (OpenESB package)
 - > ETL (Extract, Transform, and Load) (OpenESB package)
 - > EDM (Enterprise Data Mashup) (OpenESB package)
 - > And more

Types of SOA “NetBeans” Projects

BPEL Module Project

- BPEL Module project is a group of source files which includes
 - > XML Schema (*.xsd) files
 - > WSDL files
 - > BPEL files
- Within a BPEL Module project, you can author a business process compliant with the WS-BPEL 2.0 language specification.
- Will be added to a Composite application as a JBI module

Composite Application Project

- Composite Application project is a project whose primary purpose is to assemble a deployment unit for the Java Business Integration (JBI) server
 - > BPEL Module projects must be added to a Composite Application project in order to be deployed to the BPEL runtime.
- The Composite Application Project can also be used to create and execute test cases that can then be run, in JUnit fashion, against the deployed BPEL processes.

Composite Application Project

- With a Composite Application project, you can:
 - > Assemble an application that uses multiple project types (BPEL, XSLT, IEP, SQL, etc.)
 - > Configure external/edge access protocols (SOAP, JMS, SMTP, and others)
 - > Build JBI deployment packages
 - > Deploy the application image to the target JBI server
 - > Monitor the status of JBI server components and applications

NetBeans 6.0 Preview, SOA Documentation

May 2007

This page lists all new and updated documentation available for the SOA functionality in NetBeans 6.0 Preview (M9). For more information about the runtime parts of SOA, see [Open ESB](#).

For additional information about this Preview, see [NetBeans IDE 6.0 Preview Release Information](#) and [NetBeans IDE 6.0 Preview Documentation](#).

Java EE SE

JavaEE SE

- Ideal place to execute complex business logic
- Bridge between JavaEE container and JBI container
- Provides support for
 - > Transactions
 - > Resource Pooling
 - > Security
- Code re-use – Invoke your EJBs/web applications from OpenESB components (BPEL SE)
- Ability to expose your EJB/Web applications to multiple transports (using BCs) – just add bindings to your WSDL

Scenario 1: Remote through HTTP BC

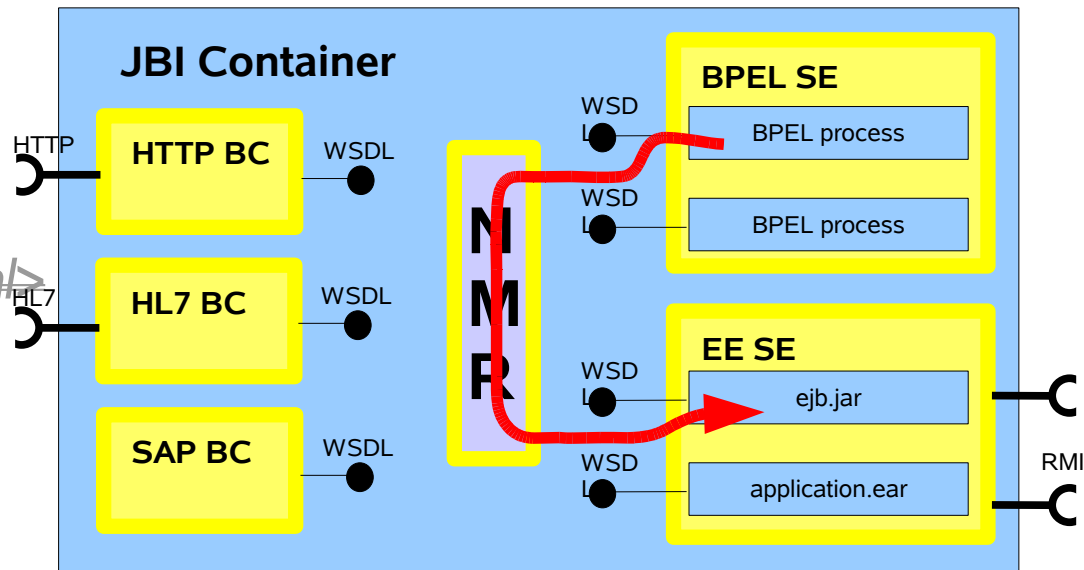

- BPEL
- NMR
- HTTP BC
- *Marshall DOM to <xml>*
- SOAP/HTTP
- Network layer

- Network layer
- SOAP/HTTP
- JAXWS
- *Unmarshal <xml>*
- *Create DOM*
- JAXB

Scenario 2: Local through NMR

- BPEL
- ➔ NMR
- ➔ ~~HTTP BG~~
- ➔ ~~Marshall DOM to <xml>~~
- ➔ ~~SOAP/HTTP~~
- ➔ ~~Network layer~~
- ➔ ~~SOAP/HTTP~~
- ➔ JAXWS
- ➔ ~~Unmarshal <xml>~~
- ➔ ~~Create DOM~~
- ➔ JAXB
- ➔ WS.helloWorld(name)

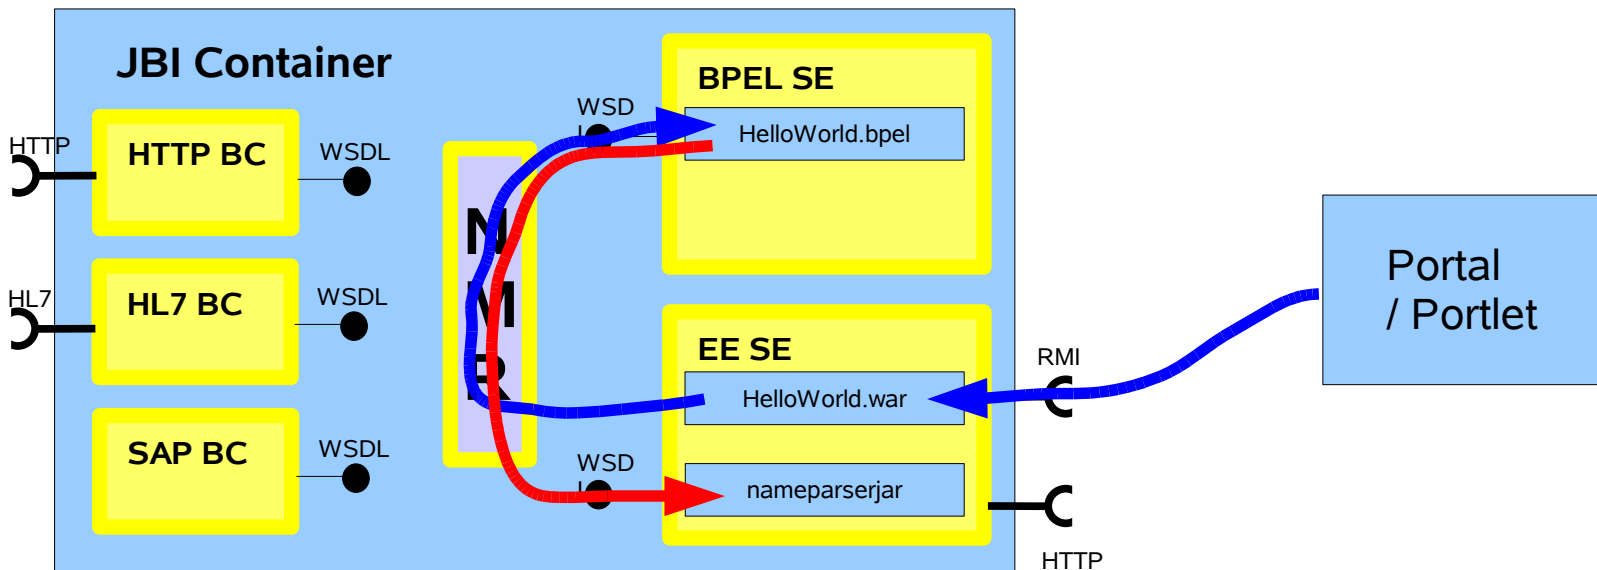

Advantages:

- > Performance
- > Transaction propagation
- > Security context propagation

Likewise: EJB to BPEL

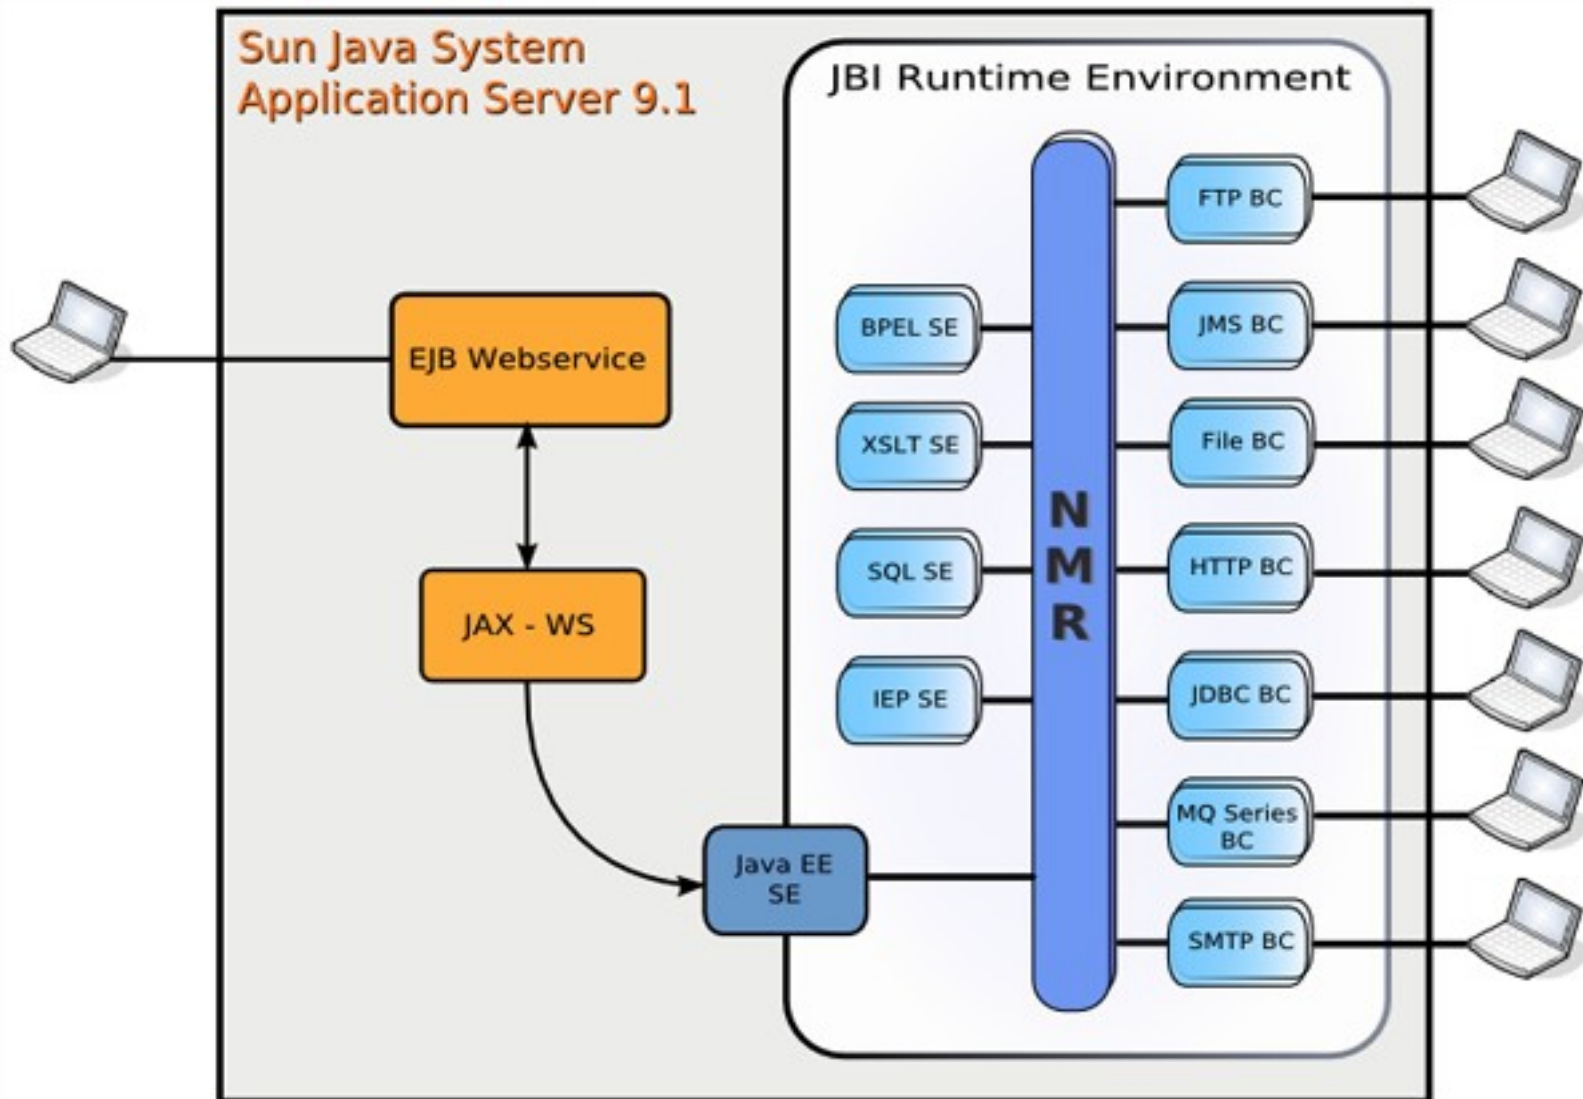

Scenario: Portal + EE + BPEL

- Portlet gets name, invokes WAR which calls BPEL to orchestrate process
- BPEL activity requires complex business logic
 - > executes faster in EJB right

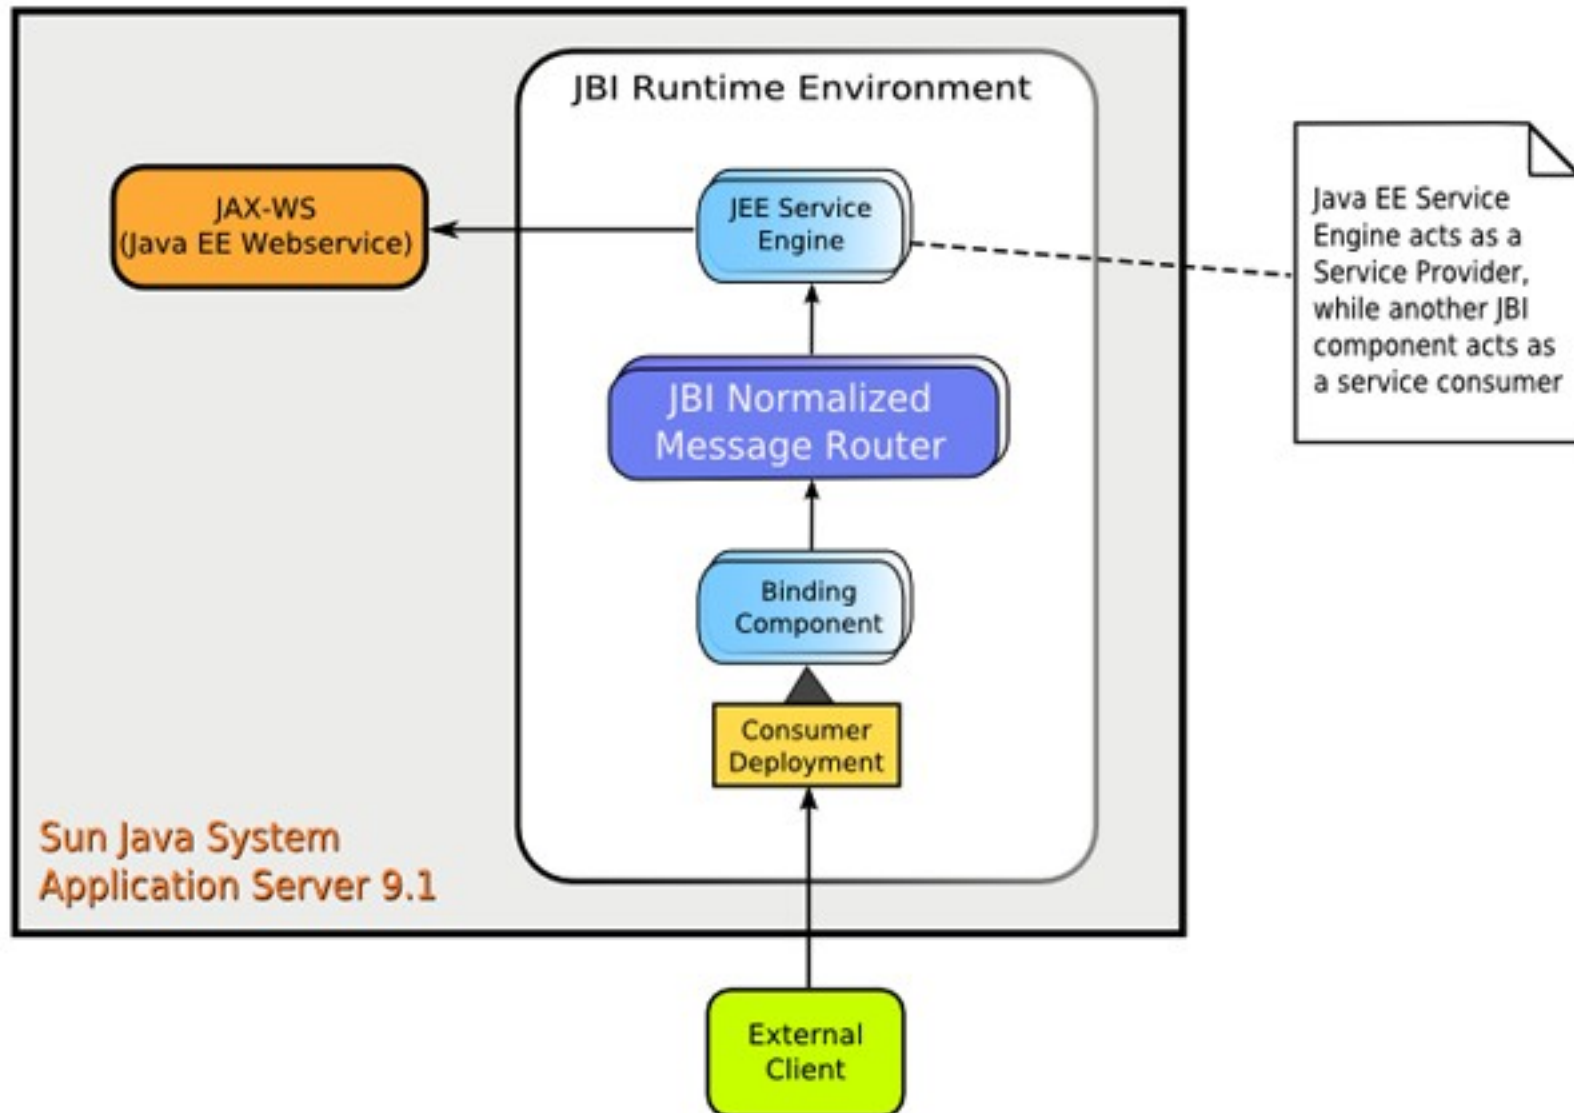

Java EE Service Engine: Functions as Bridge between App Server and JBI Runtime Env.

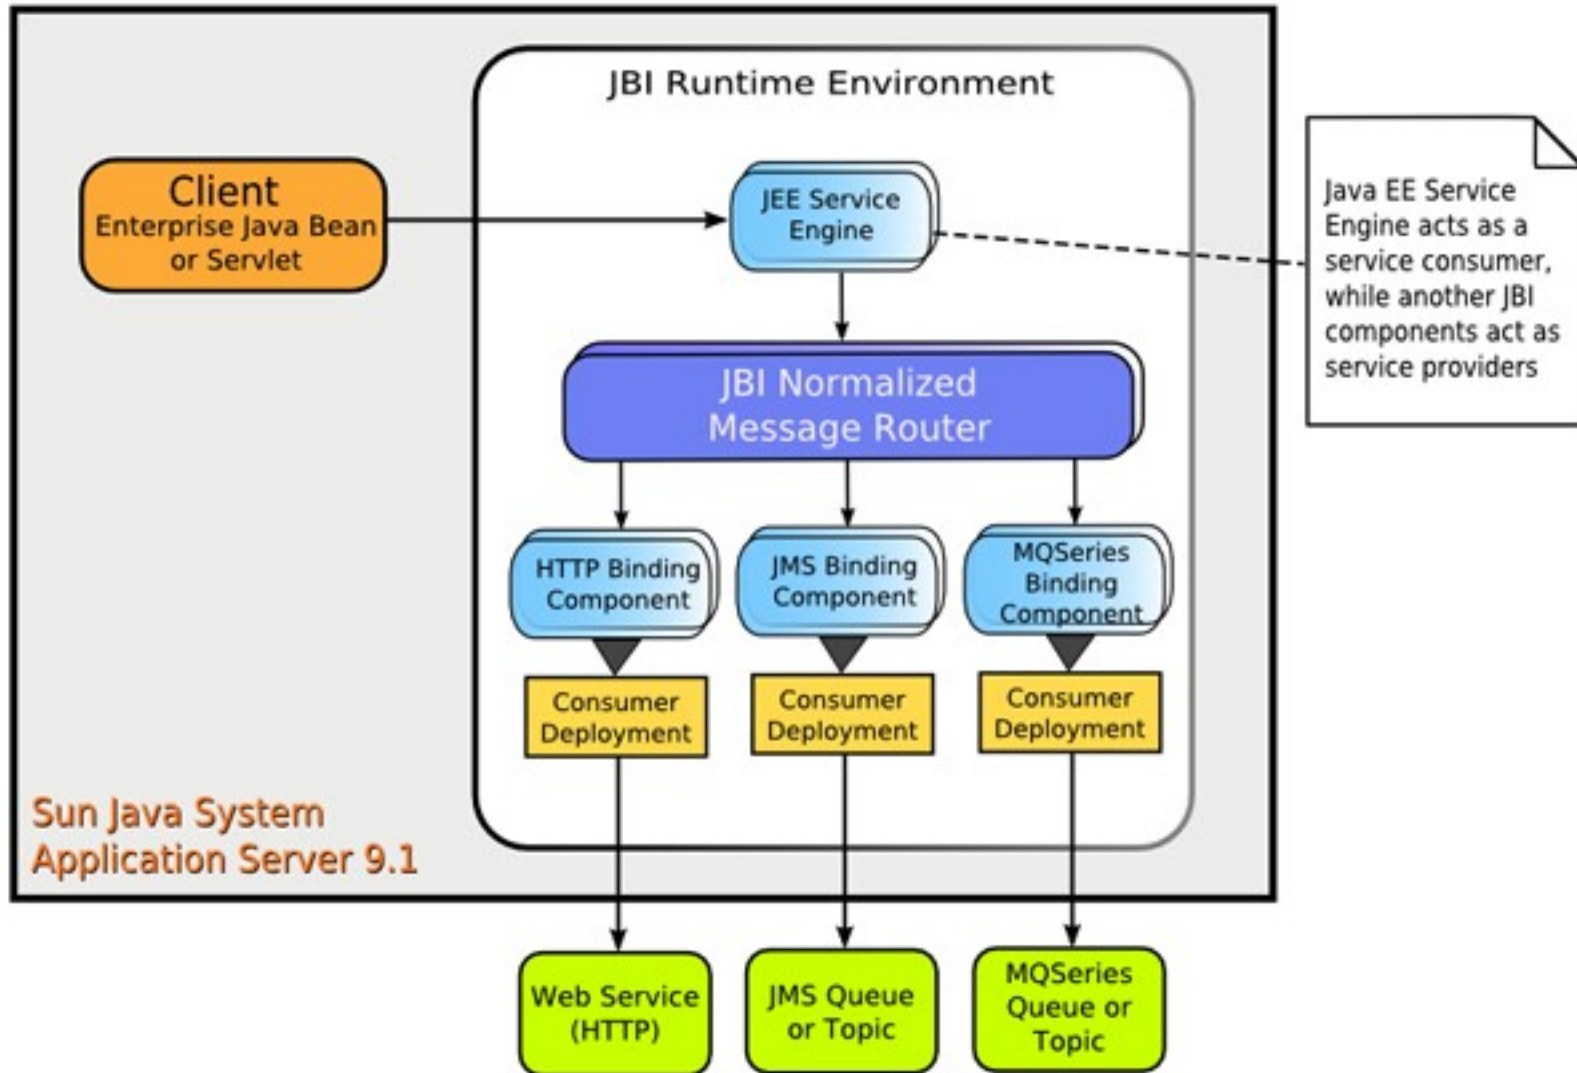

Java EE S.E. As a Bridge

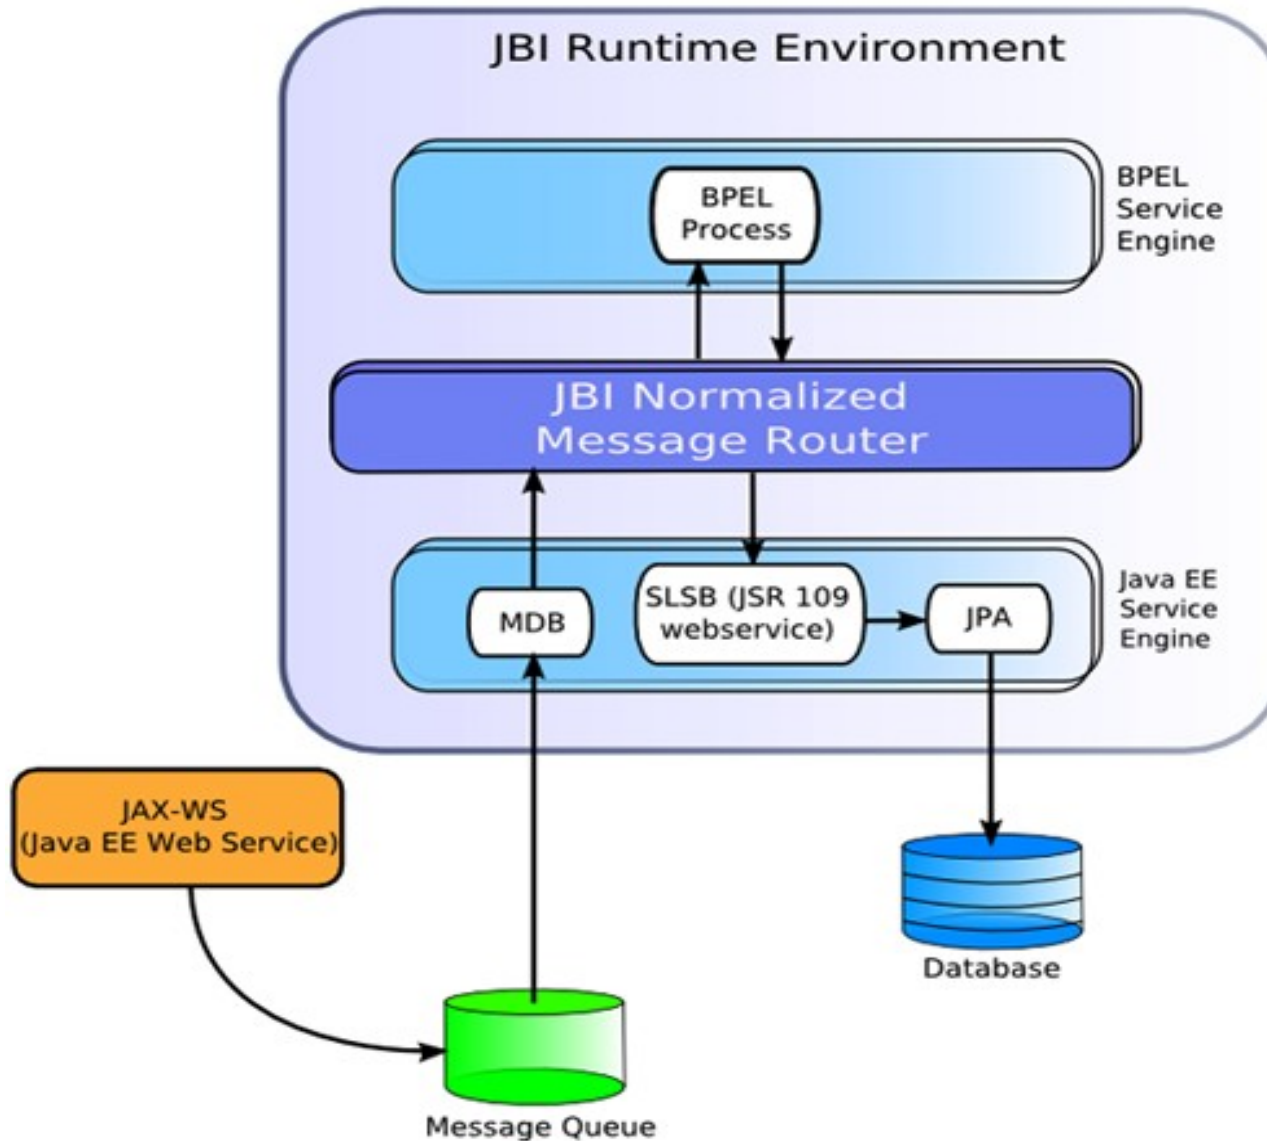

Java EE S.E. as a Service Provider

Java EE S.E. as a Service Consumer

Java EE S.E. Use Case

Java EE S.E. Use Cases

- BPEL Service Engine calling an Enterprise Java Bean web service
- Message Driven Bean or Servlet calling a BPEL Process
- Enterprise Java Bean web service called through a JMS transport using the JMS Binding Component.
- Java EE components calling web services using the FTP Binding Component
- Java EE components making web service calls through SMTP transport using the SMTP Binding Component

Summary

Summary

- SOA enables flexible and agile enterprise application architecture
- Services can be created and used using Java EE
- BPEL is a service orchestration language for creating composite applications
- Services can be re-implemented using other technologies as long as service interfaces are preserved without changing consumers
- Java Business Integration (JBI) is the enabling infrastructure

SOA using OpenESB, BPEL, and NetBeans
