NAME

Pod::Simple::PullParserEndToken -- end-tokens from Pod::Simple::PullParser

SYNOPSIS

(See *Pod::Simple::PullParser*)

DESCRIPTION

When you do $parser->get_token on a *Pod::Simple::PullParser*, you might get an object of this class.

This is a subclass of *Pod::Simple::PullParserToken* and inherits all its methods, and adds these methods:

$token->tagname

This returns the tagname for this end-token object. For example, parsing a "=head1 ..." line will give you a start-token with the tagname of "head1", token(s) for its content, and then an end-token with the tagname of "head1".

$token->tagname(*somestring*)

This changes the tagname for this end-token object. You probably won't need to do this.

$token->tag(...)

A shortcut for $token->tagname(...)

$token->is_tag(*somestring*) or $token->is_tagname(*somestring*)

These are shortcuts for `$token->tag() eq `*somestring*

You're unlikely to ever need to construct an object of this class for yourself, but if you want to, call `Pod::Simple::PullParserEndToken->new( `*tagname*` )`
