

**NAME**

CPANPLUS::Backend::RV

**SYNOPSIS**

```

### create a CPANPLUS::Backend::RV object
$backend_rv      = CPANPLUS::Backend::RV->new(
                    ok           => $boolean,
                    args        => $args,
                    rv           => $return_value
                    function     => $calling_function );

### if you have a CPANPLUS::Backend::RV object
$passed_args    = $backend_rv->args;    # args passed to function
$ok             = $backend_rv->ok;      # boolean indication overall
# result of the call
$function       = $backend_rv->function # name of the calling
# function
$rv             = $backend_rv->rv       # the actual return value
# of the calling function

```

**DESCRIPTION**

This module provides return value objects for multi-module calls to CPANPLUS::Backend. In boolean context, it returns the status of the overall result (ie, the same as the `ok` method would).

**METHODS****new( ok => BOOL, args => DATA, rv => DATA, [function => \$method\_name] )**

Creates a new CPANPLUS::Backend::RV object from the data provided. This method should only be called by CPANPLUS::Backend functions. The accessors may be used by users inspecting an RV object.

All the argument names can be used as accessors later to retrieve the data.

Arguments:

`ok`

Boolean indicating overall success

`args`

The arguments provided to the function that returned this rv object. Useful to inspect later to see what was actually passed to the function in case of an error.

`rv`

An arbitrary data structure that has the detailed return values of each of your multi-module calls.

`function`

The name of the function that created this rv object. Can be explicitly passed. If not, `new()` will try to deduce the name from `caller()` information.
