

#### NAME

Pod::Simple::PullParserTextToken -- text-tokens from Pod::Simple::PullParser

#### **SYNOPSIS**

(See Pod::Simple::PullParser)

### DESCRIPTION

When you do \$parser->get token on a *Pod::Simple::PullParser*, you might get an object of this class.

This is a subclass of *Pod::Simple::PullParserToken* and inherits all its methods, and adds these methods:

### \$token->text

This returns the text that this token holds. For example, parsing C<foo> will return a C start-token, a text-token, and a C end-token. And if you want to get the "foo" out of the text-token, call \$token->text

### \$token->text(somestring)

This changes the string that this token holds. You probably won't need to do this.

### \$token->text\_r()

This returns a scalar reference to the string that this token holds. This can be useful if you don't want to memory-copy the potentially large text value (well, as large as a paragraph or a verbatim block) as calling \$token->text would do.

Or, if you want to alter the value, you can even do things like this:

```
for ( ${ $token->text_r } ) { # Aliases it with $_ !!

s/ The / the /g; # just for example

if( 'A' eq chr(65) ) { # (if in an ASCII world)
    tr/\xA0/ /;
    tr/\xAD//d;
}

...or however you want to alter the value...
}
```

You're unlikely to ever need to construct an object of this class for yourself, but if you want to, call Pod::Simple::PullParserTextToken->new( text )
