

overloading - perl pragma to lexically control overloading

## **SYNOPSIS**

```
{
no overloading;
my $str = "$object"; # doesn't call stringification overload
}
# it's lexical, so this stringifies:
warn "$object";
# it can be enabled per op
no overloading qw("");
warn "$object";
# and also reenabled
use overloading;
```

## DESCRIPTION

This pragma allows you to lexically disable or enable overloading.

```
no overloading
```

Disables overloading entirely in the current lexical scope.

no overloading @ops

Disables only specific overloads in the current lexical scope.

```
use overloading
```

Reenables overloading in the current lexical scope.

```
use overloading @ops
```

Reenables overloading only for specific ops in the current lexical scope.
