NAME

Pod::Perldoc::GetOptsOO - Customized option parser for Pod::Perldoc

SYNOPSIS

```
use Pod::Perldoc::GetOptsOO ();

Pod::Perldoc::GetOptsOO::getopts( $obj, \@args, $truth )
  or die "wrong usage";
```

DESCRIPTION

Implements a customized option parser used for *Pod::Perldoc*.

Rather like Getopt::Std's getopts:

Call Pod::Perldoc::GetOptsOO::getopts($object, \@ARGV, $truth)

Given -n, if there's a opt_n_with, it'll call $object->opt_n_with(ARGUMENT) (e.g., "-n foo" => $object->opt_n_with('foo'). Ditto "-nfoo")

Otherwise (given -n) if there's an opt_n, we'll call it $object->opt_n($truth) (Truth defaults to 1)

Otherwise we try calling $object->handle_unknown_option('n') (and we increment the error count by the return value of it)

If there's no handle_unknown_option, then we just warn, and then increment the error counter

The return value of Pod::Perldoc::GetOptsOO::getopts is true if no errors, otherwise it's false.
