Contents

1	Linear Algebra	25
1.1	L2 Norm	25
1.2	Inner Product Spaces and Gradient Derivative	28
1.2.1	Real inner product spaces	28
1.2.2	Class instances	33
1.2.3	Gradient derivative	36
1.3	Cartesian Products as Vector Spaces	37
1.3.1	Product is a Module	38
1.3.2	Product is a Real Vector Space	38
1.3.3	Product is a Metric Space	39
1.3.4	Product is a Complete Metric Space	47
1.3.5	Product is a Normed Vector Space	47
1.3.6	Product is Finite Dimensional	51
1.4	Finite-Dimensional Inner Product Spaces	53
1.4.1	Interlude: Some properties of real sets	53
1.4.2	Type class of Euclidean spaces	53
1.4.3	Subclass relationships	57
1.4.4	Class instances	58
1.4.5	Locale instances	60
1.5	Elementary Linear Algebra on Euclidean Spaces	62
1.5.1	More interesting properties of the norm	64
1.5.2	Substandard Basis	65
1.5.3	Orthogonality	66
1.5.4	Orthogonality of a transformation	68
1.5.5	Bilinear functions	69
1.5.6	Adjoint	70
1.5.7	Euclidean Spaces as Typeclass	72
1.5.8	Linearity and Bilinearity continued	72
1.5.9	We continue	76
1.5.10	Infinity norm	81
1.5.11	Collinearity	85
1.5.12	Properties of special hyperplanes	88
1.5.13	Orthogonal bases and Gram-Schmidt process	90

1.5.14	Decomposing a vector into parts in orthogonal subspaces	93
1.5.15	Linear functions are (uniformly) continuous on any set	100
1.5.16	Topological properties of linear functions	100
1.6	Affine Sets	101
1.6.1	Affine set and affine hull	103
1.6.2	Affine Dependence	115
1.6.3	Some Properties of Affine Dependent Sets	119
1.6.4	Affine Dimension of a Set	124
1.7	Convex Sets and Functions	136
1.7.1	Convex Sets	136
1.7.2	Explicit expressions for convexity in terms of arbitrary sums	140
1.7.3	Convex Functions on a Set	143
1.7.4	Arithmetic operations on sets preserve convexity	146
1.7.5	Convexity of real functions	155
1.7.6	Some inequalities	157
1.7.7	Misc related lemmas	159
1.7.8	Cones	159
1.7.9	Connectedness of convex sets	163
1.7.10	Convex hull	164
1.7.11	Relations among closure notions and corresponding hulls	174
1.7.12	Caratheodory's theorem	175
1.7.13	Some Properties of subset of standard basis	178
1.7.14	Moving and scaling convex hulls	178
1.7.15	Convexity of cone hulls	179
1.7.16	Radon's theorem	180
1.7.17	Helly's theorem	183
1.7.18	Epigraphs of convex functions	184
1.7.19	A bound within a convex hull	186
1.8	Definition of Finite Cartesian Product Type	187
1.8.1	Finite Cartesian products, with indexing and lambdas .	188
1.8.2	Cardinality of vectors	189
1.8.3	Group operations and class instances	191
1.8.4	Basic componentwise operations on vectors	192
1.8.5	Real vector space	193
1.8.6	Topological space	194
1.8.7	Metric space	196
1.8.8	Normed vector space	199
1.8.9	Inner product space	200
1.8.10	Euclidean space	201
1.8.11	A naive proof procedure to lift really trivial arithmetic stuff from the basis of the vector space	203
1.8.12	Some frequently useful arithmetic lemmas over vectors	204
1.8.13	Matrix operations	207

1.8.14	Inverse matrices (not necessarily square)	212
1.9	Linear Algebra on Finite Cartesian Products	213
1.9.1	Type $(\text{'a'}, \text{'n'})$ <i>vec</i> and fields as vector spaces	213
1.9.2	Rank of a matrix	224
1.9.3	Lemmas for working on $\text{real}^1/2/3/4$	228
1.9.4	The collapse of the general concepts to dimension one	229
1.9.5	Routine results connecting the types $(\text{real}, 1)$ <i>vec</i> and <i>real</i>	229
1.9.6	Explicit vector construction from lists	230
1.9.7	lambda skolemization on cartesian products	231
1.9.8	Explicit formulas for low dimensions	233
1.9.9	Orthogonality of a matrix	234
1.9.10	Finding an Orthogonal Matrix	235
1.9.11	Scaling and isometry	237
1.9.12	Induction on matrix row operations	239
1.10	Traces and Determinants of Square Matrices	244
1.10.1	Trace	244
1.10.2	Relation to invertibility	259
1.10.3	Cramer's rule	262
1.10.4	Rotation, reflection, rotoinversion	265
2	Topology	269
2.1	Elementary Topology	269
2.1.1	Topological Basis	270
2.1.2	Countable Basis	272
2.1.3	Polish spaces	281
2.1.4	Limit Points	281
2.1.5	Interior of a Set	285
2.1.6	Closure of a Set	289
2.1.7	Frontier (also known as boundary)	292
2.1.8	Filters and the "eventually true" quantifier	294
2.1.9	Limits	295
2.1.10	Compactness	299
2.1.11	Cartesian products	313
2.1.12	Continuity	316
2.1.13	Homeomorphisms	319
2.1.14	On Linorder Topologies	323
2.2	Operators involving abstract topology	325
2.2.1	General notion of a topology as a value	325
2.2.2	The discrete topology	329
2.2.3	Subspace topology	330
2.2.4	The canonical topology from the underlying type class	334
2.2.5	Basic "localization" results are handy for connectedness.	334

2.2.6	Derived set (set of limit points)	337
2.2.7	Closure with respect to a topological space	340
2.2.8	Frontier with respect to topological space	349
2.2.9	Locally finite collections	353
2.2.10	Continuous maps	356
2.2.11	Open and closed maps (not a priori assumed continuous)	363
2.2.12	Quotient maps	367
2.2.13	Separated Sets	374
2.2.14	Homeomorphisms	376
2.2.15	Relation of homeomorphism between topological spaces	385
2.2.16	Connected topological spaces	386
2.2.17	Compact sets	396
2.2.18	Embedding maps	405
2.2.19	Retraction and section maps	407
2.2.20	Continuity	409
2.2.21	Half-global and completely global cases	410
2.2.22	The topology generated by some (open) subsets	414
2.2.23	Topology bases and sub-bases	416
2.2.24	Pullback topology	420
2.2.25	Proper maps (not a priori assumed continuous)	421
2.2.26	Perfect maps (proper, continuous and surjective)	426
2.3	Abstract Topology 2	427
2.3.1	Closure	429
2.3.2	Frontier	430
2.3.3	Compactness	431
2.3.4	Continuity	432
2.3.5	Equality of continuous functions on closure and related results	432
2.3.6	A function constant on a set	433
2.3.7	Continuity relative to a union.	433
2.3.8	Inverse function property for open/closed maps	434
2.3.9	Seperability	436
2.3.10	Closed Maps	437
2.3.11	Open Maps	438
2.3.12	Quotient maps	438
2.3.13	Pasting lemmas for functions, for of casewise definitions	441
2.3.14	Retractions	445
2.3.15	Retractions on a topological space	450
2.3.16	Paths and path-connectedness	452
2.3.17	Connected components	455
2.4	Connected Components	461
2.4.1	Connectedness	461
2.4.2	Connected components, considered as a connectedness relation or a set	462

2.4.3	The set of connected components of a set	467
2.4.4	Proving a function is constant on a connected set by proving that a level set is open	471
2.4.5	Preservation of Connectedness	471
2.4.6	Lemmas about components	474
2.4.7	Constancy of a function from a connected set into a finite, disconnected or discrete set	476
2.4.8	nhdsin and atin	477
2.4.9	Limits in a topological space	478
2.4.10	Pointwise continuity in topological spaces	481
2.4.11	Combining theorems for continuous functions into the reals	482
3	Functional Analysis	485
3.1	A decision procedure for metric spaces	485
3.2	Elementary Metric Spaces	487
3.2.1	Open and closed balls	487
3.2.2	Limit Points	493
3.2.3	Perfect Metric Spaces	494
3.2.4	?	494
3.2.5	Interior	495
3.2.6	Frontier	495
3.2.7	Limits	496
3.2.8	Continuity	498
3.2.9	Closure and Limit Characterization	501
3.2.10	Boundedness	503
3.2.11	Compactness	505
3.2.12	Banach fixed point theorem	508
3.2.13	Edelstein fixed point theorem	512
3.2.14	The diameter of a set	512
3.2.15	Metric spaces with the Heine-Borel property	517
3.2.16	Completeness	520
3.2.17	Finite intersection property	526
3.2.18	Properties of Balls and Spheres	527
3.2.19	Distance from a Set	527
3.2.20	Infimum Distance	528
3.2.21	Separation between Points and Sets	533
3.2.22	Uniform Continuity	535
3.2.23	Continuity on a Compact Domain Implies Uniform Con- tinuity	537
3.2.24	Theorems relating continuity and uniform continuity to closures	539

3.2.25	With Abstract Topology (TODO: move and remove dependency?)	544
3.2.26	Closed Nest	545
3.2.27	Making a continuous function avoid some value in a neighbourhood	547
3.2.28	Consequences for Real Numbers	548
3.2.29	The infimum of the distance between two sets	551
3.3	Elementary Normed Vector Spaces	555
3.3.1	Orthogonal Transformation of Balls	556
3.3.2	Various Lemmas Combining Imports	556
3.3.3	Support	557
3.3.4	Intervals	558
3.3.5	Limit Points	559
3.3.6	Balls and Spheres in Normed Spaces	561
3.3.7	Various Lemmas on Normed Algebras	564
3.3.8	Filters	565
3.3.9	Trivial Limits	565
3.3.10	Limits	565
3.3.11	Limit Point of Filter	568
3.3.12	Boundedness	568
3.3.13	Relations among convergence and absolute convergence for power series	572
3.3.14	Normed spaces with the Heine-Borel property	572
3.3.15	Intersecting chains of compact sets and the Baire property	573
3.3.16	Continuity	577
3.3.17	Arithmetic Preserves Topological Properties	579
3.3.18	Homeomorphisms	586
3.3.19	Discrete	588
3.3.20	Completeness of "Isometry" (up to constant bounds)	589
3.3.21	Connected Normed Spaces	590
3.4	Linear Decision Procedure for Normed Spaces	593
4	Vector Analysis	597
4.1	Elementary Topology in Euclidean Space	597
4.1.1	Continuity of the representation WRT an orthogonal basis	597
4.1.2	Balls in Euclidean Space	599
4.1.3	Boxes	604
4.1.4	General Intervals	617
4.1.5	Bounded Projections	621
4.1.6	Structural rules for pointwise continuity	621
4.1.7	Structural rules for setwise continuity	622
4.1.8	Openness of halfspaces.	622
4.1.9	Closure and Interior of halfspaces and hyperplanes	622

4.1.10	Some more convenient intermediate-value theorem formulations	625
4.1.11	Limit Component Bounds	625
4.1.12	Class Instances	631
4.1.13	Compact Boxes	633
4.1.14	Componentwise limits and continuity	635
4.1.15	Continuous Extension	637
4.1.16	Separability	639
4.1.17	Diameter	641
4.1.18	Relating linear images to open/closed/interior/closure/connected	642
4.1.19	"Isometry" (up to constant bounds) of Injective Linear Map	645
4.1.20	Some properties of a canonical subspace	648
4.1.21	Set Distance	650
4.2	Convex Sets and Functions on (Normed) Euclidean Spaces	652
4.2.1	Topological Properties of Convex Sets and Functions	652
4.2.2	Relative interior of a set	653
4.2.3	Openness and compactness are preserved by convex hull operation	667
4.2.4	Extremal points of a simplex are some vertices	672
4.2.5	Closest point of a convex set is unique, with a continuous projection	676
4.2.6	More convexity generalities	684
4.2.7	Convex set as intersection of halfspaces	685
4.2.8	Convexity of general and special intervals	685
4.2.9	On <i>real</i> , <i>is_interval</i> , <i>convex</i> and <i>connected</i> are all equivalent	687
4.2.10	Another intermediate value theorem formulation	688
4.2.11	A bound within an interval	689
4.2.12	Representation of any interval as a finite convex hull	691
4.2.13	Bounded convex function on open set is continuous	693
4.2.14	Upper bound on a ball implies upper and lower bounds	695
4.3	Operator Norm	697
4.4	Line Segment	702
4.4.1	Topological Properties of Convex Sets, Metric Spaces and Functions	702
4.4.2	Midpoint	706
4.4.3	Open and closed segments	707
4.4.4	Betweenness	724
4.5	Limits on the Extended Real Number Line	727
4.5.1	Extended-Real.thy	735
4.5.2	Extended-Nonnegative-Real.thy	748
4.5.3	monoset	749

4.5.4	Relate extended reals and the indicator function	767
4.6	Radius of Convergence and Summation Tests	768
4.6.1	Convergence tests for infinite sums	768
4.6.2	Radius of convergence	778
4.7	Uniform Limit and Uniform Convergence	788
4.7.1	Definition	788
4.7.2	Exchange limits	789
4.7.3	Uniform limit theorem	790
4.7.4	Weierstrass M-Test	794
4.7.5	Structural introduction rules	796
4.7.6	Power series and uniform convergence	802
4.8	Function Topology	804
4.8.1	The product topology	805
4.8.2	The Alexander subbase theorem	823
4.8.3	Open Pi-sets in the product topology	831
4.8.4	Relationship with connected spaces, paths, etc.	834
4.8.5	Projections from a function topology to a component	840
4.9	Bounded Linear Function	841
4.9.1	Intro rules for <i>bounded_linear</i>	841
4.9.2	declaration of derivative/continuous/tendsto introduction rules for bounded linear functions	842
4.9.3	Type of bounded linear functions	843
4.9.4	Type class instantiations	843
4.9.5	On Euclidean Space	848
4.9.6	concrete bounded linear functions	853
4.9.7	The strong operator topology on continuous linear operators	857
4.10	Derivative	859
4.10.1	Derivatives	859
4.10.2	Derivative with composed bilinear function	859
4.10.3	Differentiability	861
4.10.4	Frechet derivative and Jacobian matrix	863
4.10.5	Differentiability implies continuity	864
4.10.6	The chain rule	865
4.10.7	Composition rules stated just for differentiability	866
4.10.8	Uniqueness of derivative	866
4.10.9	Derivatives of local minima and maxima are zero	869
4.10.10	One-dimensional mean value theorem	871
4.10.11	More general bound theorems	873
4.10.12	Differentiability of inverse function (most basic form)	881
4.10.13	Uniformly convergent sequence of derivatives	887
4.10.14	Differentiation of a series	893
4.10.15	Derivative as a vector	896
4.10.16	Field differentiability	902

4.10.17	Field derivative	907
4.10.18	Relation between convexity and derivative	910
4.10.19	Partial derivatives	912
4.10.20	Differentiable case distinction	916

2.2.10 Continuous maps

We will need to deal with continuous maps in terms of topologies and not in terms of type classes, as defined below.

definition *continuous_map* **where**

```

continuous_map X Y f  $\equiv$ 
  ( $\forall x \in \text{topspace } X. f\ x \in \text{topspace } Y$ )  $\wedge$ 
  ( $\forall U. \text{openin } Y\ U \longrightarrow \text{openin } X\ \{x \in \text{topspace } X. f\ x \in U\}$ )

```

lemma *continuous_map*:

```

continuous_map X Y f  $\longleftrightarrow$ 
   $f ' (\text{topspace } X) \subseteq \text{topspace } Y \wedge (\forall U. \text{openin } Y\ U \longrightarrow \text{openin } X\ \{x \in \text{topspace } X. f\ x \in U\})$ 
  by (auto simp: continuous_map_def)

```

lemma *continuous_map_image_subset_topspace*:

```

continuous_map X Y f  $\implies f ' (\text{topspace } X) \subseteq \text{topspace } Y$ 
  by (auto simp: continuous_map_def)

```

lemma *continuous_map_on_empty*: $\text{topspace } X = \{\}$ $\implies \text{continuous\_map } X\ Y\ f$

```

  by (auto simp: continuous_map_def)

```

lemma *continuous_map_closedin*:

```

continuous_map X Y f  $\longleftrightarrow$ 
  ( $\forall x \in \text{topspace } X. f\ x \in \text{topspace } Y$ )  $\wedge$ 
  ( $\forall C. \text{closedin } Y\ C \longrightarrow \text{closedin } X\ \{x \in \text{topspace } X. f\ x \in C\}$ )

```

proof –

```

  have ( $\forall U. \text{openin } Y\ U \longrightarrow \text{openin } X\ \{x \in \text{topspace } X. f\ x \in U\}$ ) =
    ( $\forall C. \text{closedin } Y\ C \longrightarrow \text{closedin } X\ \{x \in \text{topspace } X. f\ x \in C\}$ )

```

```

  if  $\bigwedge x. x \in \text{topspace } X \implies f\ x \in \text{topspace } Y$ 

```

proof –

```

  have eq:  $\{x \in \text{topspace } X. f\ x \in \text{topspace } Y \wedge f\ x \notin C\} = (\text{topspace } X - \{x \in \text{topspace } X. f\ x \in C\})$  for  $C$

2.2.22 The topology generated by some (open) subsets

In the definition below of a generated topology, the *Empty* case is not necessary, as it follows from *UN* taking for K the empty set. However, it is convenient to have, and is never a problem in proofs, so I prefer to write it

down explicitly.

We do not require $UNIV$ to be an open set, as this will not be the case in applications. (We are thinking of a topology on a subset of $UNIV$, the remaining part of $UNIV$ being irrelevant.)

inductive *generate_topology_on* **for** S **where**

Empty: *generate_topology_on* $S \ \{\}$
 $|$ *Int:* *generate_topology_on* $S \ a \implies \text{generate\_topology\_on } S \ b \implies \text{generate\_topology\_on } S \ (a \cap b)$

2.2.24 Pullback topology

Pulling back a topology by map gives again a topology. *subtopology* is a special case of this notion, pulling back by the identity. We introduce the general notion as we will need it to define the strong operator topology on the space of continuous linear operators, by pulling back the product topology on the space of all functions.

pullback_topology $A f T$ is the pullback of the topology T by the map f on the set A .

definition *pullback_topology*::('a set) $\Rightarrow$ ('a $\Rightarrow$ 'b) $\Rightarrow$ ('b topology) $\Rightarrow$ ('a topology)
where *pullback_topology* $A f T = \text{topology } (\lambda S. \exists U. \text{openin } T U \wedge S = f - 'U \cap A)$

lemma *istopology_pullback_topology*:

Continuity of addition

The next few lemmas remove an unnecessary assumption in *tendsto_add_ereal*, culminating in *tendsto_add_ereal_general* which essentially says that the addition is continuous on *ereal* times *ereal*, except at $(-\infty, \infty)$ and $(\infty, -\infty)$. It is much more convenient in many situations, see for instance the proof of *tendsto_sum_ereal* below.

```

lemma tendsto_add_ereal_PInf:
  fixes y :: ereal
  assumes y:  $y \neq -\infty$ 
  assumes f:  $(f \longrightarrow \infty) F$  and g:  $(g \longrightarrow y) F$

4.8 Function Topology

We want to define the general product topology.

The product topology on a product of topological spaces is generated by the sets which are products of open sets along finitely many coordinates, and the whole space along the other coordinates. This is the coarsest topology for which the projection to each factor is continuous.

To form a product of objects in Isabelle/HOL, all these objects should be subsets of a common type 'a. The product is then $\prod_{i \in I} X_i$, the set of elements from 'a such that the i -th coordinate belongs to X_i for all $i \in I$.

Hence, to form a product of topological spaces, all these spaces should be subsets of a common type. This means that type classes can not be used to define such a product if one wants to take the product of different topological spaces (as the type 'a can only be given one structure of topological space using type classes). On the other hand, one can define different topologies (as introduced in *thy*) on one type, and these topologies do not need to share the same maximal open set. Hence, one can form a product of topologies in this sense, and this works well. The big caveat is that it does not interact well with the main body of topology in Isabelle/HOL defined in terms of type classes... For instance, continuity of maps is not defined in this setting. As the product of different topological spaces is very important in several areas of mathematics (for instance adeles), I introduce below the product topology in terms of topologies, and reformulate afterwards the consequences in terms of type classes (which are of course very handy for applications).

Given this limitation, it looks to me that it would be very beneficial to revamp the theory of topological spaces in Isabelle/HOL in terms of topologies, and keep the statements involving type classes as consequences of more general statements in terms of topologies (but I am probably too naive here).

Here is an example of a reformulation using topologies. Let

$$\begin{aligned} \text{continuous\_map } T1\ T2\ f = \\ ((\forall\ U.\ \text{openin } T2\ U \longrightarrow \text{openin } T1\ (f^{-1}U \cap \text{topspace}(T1))) \\ \wedge (f^{-1}(\text{topspace } T1) \subseteq (\text{topspace } T2))) \end{aligned}$$

be the natural continuity definition of a map from the topology $T1$ to the topology $T2$. Then the current *continuous_on* (with type classes) can be redefined as

$$\begin{aligned} \text{continuous\_on } s\ f = \\ \text{continuous\_map } (\text{top\_of\_set } s)\ (\text{topology euclidean})\ f \end{aligned}$$

In fact, I need *continuous_map* to express the continuity of the projection on subfactors for the product topology, in Lemma *continuous_on_restrict_product_topology*, and I show the above equivalence in Lemma *continuous_map_iff_continuous*.

I only develop the basics of the product topology in this theory. The most important missing piece is Tychonov theorem, stating that a product of compact spaces is always compact for the product topology, even when the product is not finite (or even countable).

I realized afterwards that this theory has a lot in common with `~~/src/HOL/Library/Finite_Map.thy`.

4.8.1 The product topology

We can now define the product topology, as generated by the sets which are products of open sets along finitely many coordinates, and the whole space along the other coordinates. Equivalently, it is generated by sets which are one open set along one single coordinate, and the whole space along other coordinates. In fact, this is only equivalent for nonempty products, but for the empty product the first formulation is better (the second one gives an empty product space, while an empty product should have exactly one point, equal to *undefined* along all coordinates).

So, we use the first formulation, which moreover seems to give rise to more straightforward proofs.

definition *product_topology* :: $('i \Rightarrow ('a \text{ topology})) \Rightarrow ('i \text{ set}) \Rightarrow (('i \Rightarrow 'a) \text{ topology})$
where *product_topology* $T \ I =$
topology_generated_by $\{(\Pi_E \ i \in I. \ X \ i) \mid X. (\forall i. \text{openin } (T \ i) \ (X \ i)) \wedge \text{finite } \{i. X \ i \neq \text{topspace } (T \ i)\}\}$

abbreviation *powertop_real* :: $'a \text{ set} \Rightarrow ('a \Rightarrow \text{real}) \text{ topology}$
where *powertop_real* $\equiv \text{product\_topology } (\lambda i. \text{euclideanreal})$

The total set of the product topology is the product of the total sets along each coordinate.

4.9.7 The strong operator topology on continuous linear operators

Let $'a$ and $'b$ be two normed real vector spaces. Then the space of linear continuous operators from $'a$ to $'b$ has a canonical norm, and therefore a canonical corresponding topology (the type classes instantiation are given in *Bounded_Linear_Function.thy*).

However, there is another topology on this space, the strong operator topology, where T_n tends to T iff, for all x in $'a$, then $T_n x$ tends to $T x$. This is precisely the product topology where the target space is endowed with the norm topology. It is especially useful when $'b$ is the set of real numbers, since then this topology is compact.

We can not implement it using type classes as there is already a topology, but at least we can define it as a topology.

Note that there is yet another (common and useful) topology on operator spaces, the weak operator topology, defined analogously using the product topology, but where the target space is given the weak-* topology, i.e., the pullback of the weak topology on the bidual of the space under the canonical embedding of a space into its bidual. We do not define it there, although it could also be defined analogously.

Invertible derivative continuous at a point implies local injectivity. It's only for this we need continuity of the derivative, except of course if we want the fact that the inverse derivative is also continuous. So if we know for some other reason that the inverse function exists, it's OK.

4.10.23 The concept of continuously differentiable

John Harrison writes as follows:

“The usual assumption in complex analysis texts is that a path γ should be piecewise continuously differentiable, which ensures that the path integral exists at least for any continuous f , since all piecewise continuous functions are integrable. However, our notion of validity is weaker, just piecewise differentiability... [namely] continuity plus differentiability except on a finite set... [Our] underlying theory of integration is the Kurzweil-Henstock theory. In contrast to the Riemann or Lebesgue theory (but in common with a simple notion based on antiderivatives), this can integrate all derivatives.”

"Formalizing basic complex analysis." From Insight to Proof: Festschrift in Honour of Andrzej Trybulec. Studies in Logic, Grammar and Rhetoric 10.23 (2007): 151-165.

And indeed he does not assume that his derivatives are continuous, but the penalty is unreasonably difficult proofs concerning winding numbers. We need a self-contained and straightforward theorem asserting that all derivatives can be integrated before we can adopt Harrison's choice.
