6.1 Sigma Algebra

Sigma algebras are an elementary concept in measure theory. To measure — that is to integrate — functions, we first have to measure sets. Unfortunately, when dealing with a large universe, it is often not possible to consistently assign a measure to every subset. Therefore it is necessary to define the set of measurable subsets of the universe. A sigma algebra is such a set that has three very natural and desirable properties.

6.1.1 Families of sets

```
locale subset_class =
  fixes  $\Omega :: 'a\ set$  and  $M :: 'a\ set\ set$ 
  assumes space_closed:  $M \subseteq Pow\ \Omega$ 

lemma (in subset_class) sets_into_space:  $x \in M \implies x \subseteq \Omega$

6.8.3 Measurability

There are two natural sigma-algebras on a product space: the borel sigma algebra, generated by open sets in the product, and the product sigma algebra, countably generated by products of measurable sets along finitely many coordinates. The second one is defined and studied in `Finite_Product_Measure.thy`.

These sigma-algebras share a lot of natural properties (measurability of coordinates, for instance), but there is a fundamental difference: open sets are generated by arbitrary unions, not only countable ones, so typically many open sets will not be measurable with respect to the product sigma algebra (while all sets in the product sigma algebra are borel). The two sigma algebras coincide only when everything is countable (i.e., the product is countable, and the borel sigma algebra in the factor is countably generated). In this paragraph, we develop basic measurability properties for the borel sigma algebra, and compare it with the product sigma algebra as explained

above.

The next two statements are useful to bound Lebesgue integrals, as they avoid one integrability assumption. The price to pay is that the upper function has to be nonnegative, but this is often true and easy to check in computations.

lemma *integral_mono_AE'*:

fixes $f::\_ \Rightarrow \text{real}$

assumes *integrable* $M f AE x \text{ in } M. g x \leq f x AE x \text{ in } M. 0 \leq f x$

Covering lemma

Some technical lemmas used in the approximation results that follow. Proof of the covering lemma is an obvious multidimensional generalization of Lemma 3, p65 of Swartz's "Introduction to Gauge Integrals".

proposition *covering_lemma*:

assumes $S \subseteq \text{cbox } a \ b$ $\text{box } a \ b \neq \{\}$ *gauge* g

obtains $\mathcal{D}$ **where**

countable $\mathcal{D} \cup \mathcal{D} \subseteq \text{cbox } a \ b$

$\bigwedge K. K \in \mathcal{D} \implies \text{interior } K \neq \{\} \wedge (\exists c \ d. K = \text{cbox } c \ d)$

pairwise $(\lambda A \ B. \text{interior } A \cap \text{interior } B = \{\}) \ \mathcal{D}$

$\bigwedge K. K \in \mathcal{D} \implies \exists x \in S \cap K. K \subseteq g \ x$

$\bigwedge u \ v. \text{cbox } u \ v \in \mathcal{D} \implies \exists n. \forall i \in \text{Basis}. v \cdot i - u \cdot i = (b \cdot i - a \cdot i) / 2^n$
 $S \subseteq \bigcup \mathcal{D}$

proof –

have *aibi*: $\bigwedge i. i \in \text{Basis} \implies a \cdot i \leq b \cdot i$ **and** *normab*: $0 < \text{norm}(b - a)$

using $\langle \text{box } a \ b \neq \{\} \rangle$ *box_eq_empty* *box_sing* **by** *fastforce*+

let $?K0 = \lambda(n, f::'a \Rightarrow \text{nat}).$

$\text{cbox } (\sum i \in \text{Basis}. (a \cdot i + (f \ i / 2^n) * (b \cdot i - a \cdot i)) *_{\mathbb{R}} i)$
 $(\sum i \in \text{Basis}. (a \cdot i + ((f \ i + 1) / 2^n) * (b \cdot i - a \cdot i)) *_{\mathbb{R}} i)$

let $?D0 = ?K0 \ '(\text{SIGMA } n:\text{UNIV}. \text{Pi}_E \ \text{Basis} \ (\lambda i::'a. \text{lessThan } (2^n)))$

obtain $\mathcal{D}0$ **where** *count*: *countable* $\mathcal{D}0$

and *sub*: $\bigcup \mathcal{D}0 \subseteq \text{cbox } a \ b$

and *int*: $\bigwedge K. K \in \mathcal{D}0 \implies (\text{interior } K \neq \{\}) \wedge (\exists c \ d. K = \text{cbox } c \ d)$

and *intdj*: $\bigwedge A \ B. \llbracket A \in \mathcal{D}0; B \in \mathcal{D}0 \rrbracket \implies A \subseteq B \vee B \subseteq A \vee \text{interior } A \cap \text{interior } B = \{\}$

and *SK*: $\bigwedge x. x \in S \implies \exists K \in \mathcal{D}0. x \in K \wedge K \subseteq g \ x$

and *cbox*: $\bigwedge u \ v. \text{cbox } u \ v \in \mathcal{D}0 \implies \exists n. \forall i \in \text{Basis}. v \cdot i - u \cdot i = (b \cdot i - a \cdot i) / 2^n$

and *fin*: $\bigwedge K. K \in \mathcal{D}0 \implies \text{finite } \{L \in \mathcal{D}0. K \subseteq L\}$

proof
