The Hahn-Banach Theorem for Real Vector Spaces

Gertrud Bauer

December 12, 2021

Abstract

The Hahn-Banach Theorem is one of the most fundamental results in functional analysis. We present a fully formal proof of two versions of the theorem, one for general linear spaces and another for normed spaces. This development is based on simply-typed classical set-theory, as provided by Isabelle/HOL.

1 Preface

This is a fully formal proof of the Hahn-Banach Theorem. It closely follows the informal presentation given in Heuser's textbook [1, § 36]. Another formal proof of the same theorem has been done in Mizar [3]. A general overview of the relevance and history of the Hahn-Banach Theorem is given by Narici and Beckenstein [2].

The document is structured as follows. The first part contains definitions of basic notions of linear algebra: vector spaces, subspaces, normed spaces, continuous linear-forms, norm of functions and an order on functions by domain extension. The second part contains some lemmas about the supremum (w.r.t. the function order) and extension of non-maximal functions. With these preliminaries, the main proof of the theorem (in its two versions) is conducted in the third part. The dependencies of individual theories are as follows.

3.1 Signature

For the definition of real vector spaces a type 'a of the sort $\{plus, minus, zero\}$ is considered, on which a real scalar multiplication \cdot is declared.

```
consts prod :: real \Rightarrow 'a :: \{plus, minus, zero\} \Rightarrow 'a \ (infixr \cdot 70)
```

3.2 Vector space laws

A vector space is a non-empty set V of elements from 'a with the following vector space laws: The set V is closed under addition and scalar multiplication, addition is associative and commutative; -x is the inverse of x wrt. addition and θ is the neutral element of addition. Addition and multiplication are distributive; scalar multiplication is associative and the real number θ is the neutral element of scalar multiplication.

```

```

4.1 Definition

A non-empty subset U of a vector space V is a subspace of V, iff U is closed under addition and scalar multiplication.

```
{f locale} \ subspace =
  fixes U :: 'a::\{minus, plus, zero, uminus\} set and V
 assumes non-empty [iff, intro]: U \neq \{\}
    and subset [iff]: U \subseteq V
    and add-closed [iff]: x \in U \Longrightarrow y \in U \Longrightarrow x + y \in U
    and mult-closed [iff]: x \in U \Longrightarrow a \cdot x \in U
notation (symbols)
  subspace (infix \le 50)
declare vectorspace.intro [intro?] subspace.intro [intro?]
lemma subspace\text{-}subset \ [elim] \colon U \vartriangleleft V \Longrightarrow U \subset V
  \langle proof \rangle
lemma (in subspace) subsetD [iff]: x \in U \Longrightarrow x \in V
lemma subspaceD [elim]: U \leq V \Longrightarrow x \in U \Longrightarrow x \in V
lemma rev-subspaceD [elim?]: x \in U \Longrightarrow U \trianglelefteq V \Longrightarrow x \in V
  \langle proof \rangle
lemma (in subspace) diff-closed [iff]:
```

10 4 SUBSPACES

```
assumes vectorspace V assumes x: x \in U and y: y \in U shows x - y \in U \langle proof \rangle
```

Similar as for linear spaces, the existence of the zero element in every subspace follows from the non-emptiness of the carrier set and by vector space laws.

```
lemma (in subspace) zero [intro]:
 assumes vectorspace V
 shows \theta \in U
\langle proof \rangle
lemma (in subspace) neg-closed [iff]:
 assumes vectorspace V
 assumes x: x \in U
 \mathbf{shows} - x \in U
\langle proof \rangle
Further derived laws: every subspace is a vector space.
lemma (in subspace) vectorspace [iff]:
 assumes vectorspace V
 shows vectorspace U
\langle proof \rangle
The subspace relation is reflexive.
lemma (in vectorspace) subspace-refl [intro]: V 	ext{ } 	ext{ } V
\langle proof \rangle
The subspace relation is transitive.
```

4.2 Linear closure

 $\langle proof \rangle$

The *linear closure* of a vector x is the set of all scalar multiples of x.

```
definition lin :: ('a::\{minus,plus,zero\}) \Rightarrow 'a \ set \ \mathbf{where} \ lin \ x = \{a \cdot x \mid a. \ True\}
\mathbf{lemma} \ lin I \ [intro]: \ y = a \cdot x \Longrightarrow y \in lin \ x \ \langle proof \rangle
\mathbf{lemma} \ lin I' \ [iff]: \ a \cdot x \in lin \ x \ \langle proof \rangle
\mathbf{lemma} \ lin E \ [elim]: \ \mathbf{assumes} \ x \in lin \ v \ \mathbf{obtains} \ a :: real \ \mathbf{where} \ x = a \cdot v \ \langle proof \rangle
```

lemma (in vectorspace) subspace-trans [trans]:

 $U \, \unlhd \, V \Longrightarrow \, V \, \unlhd \, W \Longrightarrow \, U \, \unlhd \, W$

Every vector is contained in its linear closure.

 $\langle proof \rangle$

```
lemma (in vectorspace) x-lin-x [iff]: x \in V \Longrightarrow x \in lin \ x
\langle proof \rangle
lemma (in vectorspace) 0-lin-x [iff]: x \in V \Longrightarrow 0 \in lin \ x
\langle proof \rangle
Any linear closure is a subspace.
lemma (in vectorspace) lin-subspace [intro]:
 assumes x: x \in V
 shows lin x \triangleleft V
\langle proof \rangle
Any linear closure is a vector space.
lemma (in vectorspace) lin-vectorspace [intro]:
 assumes x \in V
 shows vectorspace (lin x)
\langle proof \rangle
4.3
         Sum of two vectorspaces
The sum of two vectorspaces U and V is the set of all sums of elements from
U and V.
lemma sum-def: U + V = \{u + v \mid u \ v. \ u \in U \land v \in V\}
  \langle proof \rangle
lemma sumE [elim]:
   x \in U + V \Longrightarrow (\bigwedge u \ v. \ x = u + v \Longrightarrow u \in U \Longrightarrow v \in V \Longrightarrow C) \Longrightarrow C
  \langle proof \rangle
lemma sumI [intro]:
   u \in U \Longrightarrow v \in V \Longrightarrow x = u + v \Longrightarrow x \in U + V
  \langle proof \rangle
lemma sumI' [intro]:
   u \in \, U \Longrightarrow v \in \, V \Longrightarrow u + v \in \, U \, + \, V
  \langle proof \rangle
U is a subspace of U + V.
lemma subspace-sum1 [iff]:
  assumes vectorspace\ U\ vectorspace\ V
  shows U \subseteq U + V
\langle proof \rangle
The sum of two subspaces is again a subspace.
lemma sum-subspace [intro?]:
  assumes subspace\ U\ E\ vectorspace\ E\ subspace\ V\ E
  shows U + V \subseteq E
\langle proof \rangle
The sum of two subspaces is a vectorspace.
lemma sum-vs [intro?]:
    U \leq E \Longrightarrow V \leq E \Longrightarrow vectorspace E \Longrightarrow vectorspace (U + V)
```

12 4 SUBSPACES

4.4 Direct sums

The sum of U and V is called *direct*, iff the zero element is the only common element of U and V. For every element x of the direct sum of U and V the decomposition in x = u + v with $u \in U$ and $v \in V$ is unique.

```
lemma decomp: assumes vectorspace E subspace U E subspace V E assumes direct: U \cap V = \{0\} and u1: u1 \in U and u2: u2 \in U and v1: v1 \in V and v2: v2 \in V and sum: u1 + v1 = u2 + v2 shows u1 = u2 \wedge v1 = v2 \langle proof \rangle
```

An application of the previous lemma will be used in the proof of the Hahn-Banach Theorem (see page ??): for any element $y + a \cdot x_0$ of the direct sum of a vectorspace H and the linear closure of x_0 the components $y \in H$ and a are uniquely determined.

```
lemma decomp-H':

assumes vectorspace E subspace H E

assumes y1\colon y1\in H and y2\colon y2\in H

and x'\colon x'\notin H x'\in E x'\neq 0

and eq: y1+a1\cdot x'=y2+a2\cdot x'

shows y1=y2\wedge a1=a2

\langle proof \rangle
```

Since for any element $y + a \cdot x'$ of the direct sum of a vector space H and the linear closure of x' the components $y \in H$ and a are unique, it follows from $y \in H$ that a = 0.

```
lemma decomp-H'-H:
assumes vectorspace\ E\ subspace\ H\ E
assumes t:\ t\in H
and x':\ x'\notin H\ x'\in E\ x'\neq 0
shows (SOME\ (y,\ a).\ t=y+a\cdot x'\wedge y\in H)=(t,\ 0)
\langle proof \rangle
```

The components $y \in H$ and a in $y + a \cdot x'$ are unique, so the function h' defined by $h'(y + a \cdot x') = h y + a \cdot \xi$ is definite.

```
lemma h'-definite:

fixes H

assumes h'-def:

\bigwedge x. \ h' \ x =

(let \ (y, \ a) = SOME \ (y, \ a). \ (x = y + a \cdot x' \land y \in H)

in \ (h \ y) + a * xi)

and x: \ x = y + a \cdot x'

assumes vectorspace \ E \ subspace \ H \ E

assumes y: \ y \in H

and x': \ x' \notin H \ x' \in E \ x' \neq 0

shows h' \ x = h \ y + a * xi

\langle proof \rangle
```

end

5 Normed vector spaces

theory Normed-Space imports Subspace begin

5.1 Quasinorms

A seminorm $\|\cdot\|$ is a function on a real vector space into the reals that has the following properties: it is positive definite, absolute homogeneous and subadditive.

```
locale seminorm = fixes V :: 'a :: \{minus, plus, zero, uminus\} set fixes norm :: 'a \Rightarrow real \quad (\|\cdot\|) assumes ge\text{-}zero \ [iff?] : x \in V \implies 0 \le \|x\| and abs\text{-}homogenous \ [iff?] : x \in V \implies \|a \cdot x\| = |a| * \|x\| and subadditive \ [iff?] : x \in V \implies y \in V \implies \|x + y\| \le \|x\| + \|y\| declare seminorm.intro \ [intro?] lemma (in seminorm) diff\text{-}subadditive: assumes vectorspace \ V shows x \in V \implies y \in V \implies \|x - y\| \le \|x\| + \|y\|  \langle proof \rangle lemma (in seminorm) minus: assumes vectorspace \ V shows x \in V \implies \|-x\| = \|x\|  \langle proof \rangle
```

5.2 Norms

A norm $\|\cdot\|$ is a seminorm that maps only the θ vector to θ .

```
 \begin{array}{l} \textbf{locale} \ norm = seminorm \ + \\ \textbf{assumes} \ zero\text{-}iff \ [iff] \colon x \in V \Longrightarrow (\|x\| = \theta) = (x = \theta) \\ \end{array}
```

5.3 Normed vector spaces

A vector space together with a norm is called a *normed space*.

```
locale \ normed\ -vectorspace = vectorspace + norm
```

declare normed-vectorspace.intro [intro?]

```
lemma (in normed-vectorspace) gt-zero [intro?]: assumes x: x \in V and neq: x \neq 0 shows 0 < \|x\| \langle proof \rangle
```

Any subspace of a normed vector space is again a normed vectorspace.

```
lemma subspace-normed-vs [intro?]:
fixes F E norm
assumes subspace F E normed-vectorspace E norm
```

```
\mathbf{shows}\ normed\text{-}vectorspace\ F\ norm\\ \langle proof \rangle
```

end

6 Linearforms

```
theory Linearform imports Vector-Space begin
```

A *linear form* is a function on a vector space into the reals that is additive and multiplicative.

```
{\bf locale} \ {\it linear form} =
 fixes V:: 'a::\{minus, plus, zero, uminus\} set and f
 assumes add [iff]: x \in V \Longrightarrow y \in V \Longrightarrow f(x + y) = fx + fy
   and mult [iff]: x \in V \Longrightarrow f(a \cdot x) = a * f x
declare linearform.intro [intro?]
lemma (in linearform) neg [iff]:
 assumes vectorspace\ V
 shows x \in V \Longrightarrow f(-x) = -fx
\langle proof \rangle
lemma (in linearform) diff [iff]:
 assumes vectorspace V
 shows x \in V \Longrightarrow y \in V \Longrightarrow f(x - y) = fx - fy
\langle proof \rangle
Every linear form yields \theta for the \theta vector.
lemma (in linearform) zero [iff]:
 assumes vectorspace V
  shows f \theta = \theta
\langle proof \rangle
```

7 An order on functions

theory Function-Order imports Subspace Linearform begin

end

7.1 The graph of a function

We define the graph of a (real) function f with domain F as the set

$$\{(x, f x). x \in F\}$$

So we are modeling partial functions by specifying the domain and the mapping function. We use the term "function" also for its graph.

```
type-synonym 'a graph = ('a × real) set

definition graph :: 'a set \Rightarrow ('a \Rightarrow real) \Rightarrow 'a graph
 where graph F f = \{(x, f x) \mid x. \ x \in F\}

lemma graphI [intro]: x \in F \Longrightarrow (x, f x) \in graph \ F f
\langle proof \rangle

lemma graphI2 [intro?]: x \in F \Longrightarrow \exists \ t \in graph \ F f. \ t = (x, f x)
\langle proof \rangle

lemma graphE [elim?]:
assumes (x, y) \in graph \ F f
obtains x \in F and y = f x
\langle proof \rangle
```

7.2 Functions ordered by domain extension

A function h' is an extension of h, iff the graph of h is a subset of the graph of h'.

```
lemma graph-extI: (\bigwedge x.\ x\in H\Longrightarrow h\ x=h'\ x)\Longrightarrow H\subseteq H'\\ \Longrightarrow graph\ H\ h\subseteq graph\ H'\ h'\\ \langle proof\rangle lemma graph-extD1 [dest?]: graph H\ h\subseteq graph\ H'\ h'\Longrightarrow x\in H\Longrightarrow h\ x=h'\ x\\ \langle proof\rangle lemma graph-extD2 [dest?]: graph H\ h\subseteq graph\ H'\ h'\Longrightarrow H\subseteq H'
```

7.3 Domain and function of a graph

The inverse functions to graph are domain and funct.

```
definition domain :: 'a \ graph \Rightarrow 'a \ set

where domain \ g = \{x. \ \exists \ y. \ (x, \ y) \in g\}

definition funct :: 'a \ graph \Rightarrow ('a \Rightarrow real)

where funct \ g = (\lambda x. \ (SOME \ y. \ (x, \ y) \in g))
```

The following lemma states that g is the graph of a function if the relation induced by g is unique.

```
lemma graph-domain-funct: assumes uniq: \bigwedge x\ y\ z.\ (x,\ y) \in g \Longrightarrow (x,\ z) \in g \Longrightarrow z = y shows graph (domain g) (funct g) = g \langle proof \rangle
```

7.4 Norm-preserving extensions of a function

Given a linear form f on the space F and a seminorm p on E. The set of all linear extensions of f, to superspaces H of F, which are bounded by p, is defined as follows.

```
definition
  norm-pres-extensions ::
     'a::\{plus,minus,uminus,zero\}\ set \Rightarrow ('a \Rightarrow real) \Rightarrow 'a\ set \Rightarrow ('a \Rightarrow real)
       \Rightarrow 'a graph set
  norm-pres-extensions E p F f
     = \{g. \exists H h. g = graph H h\}
          \land \ \mathit{linearform} \ \mathit{H} \ \mathit{h}
          \wedge \ H \, \trianglelefteq \, E
          \wedge \ F \trianglelefteq H
          \land \ graph \ F \ f \subseteq graph \ H \ h
          \land \ (\forall x \in H. \ h \ x \le p \ x)\}
lemma norm-pres-extensionE [elim]:
  assumes g \in norm-pres-extensions E p F f
  obtains H h
     where g = graph H h
     and linear form\ H\ h
     and H \leq E
     and F \leq H
     \mathbf{and}\ \mathit{graph}\ \mathit{F}\ \mathit{f} \subseteq \mathit{graph}\ \mathit{H}\ \mathit{h}
     and \forall x \in H. \ h \ x \leq p \ x
  \langle proof \rangle
lemma norm-pres-extensionI2 [intro]:
  linear form\ H\ h \Longrightarrow H \unlhd E \Longrightarrow F \unlhd H
     \implies graph\ F\ f\subseteq graph\ H\ h \implies \forall\ x\in H.\ h\ x\le p\ x
     \implies graph H h \in norm-pres-extensions E p F f
  \langle proof \rangle
\mathbf{lemma}\ norm\text{-}pres\text{-}extension I\text{:}
  \exists\, H\; h.\; g = graph\; H\; h
    \land \ \mathit{linearform} \ \mathit{H} \ \mathit{h}
    \wedge \ H \trianglelefteq E
     \land F \trianglelefteq H
     \land \ graph \ F \ f \subseteq graph \ H \ h
     \land (\forall x \in H. \ h \ x \leq p \ x) \Longrightarrow g \in norm\text{-}pres\text{-}extensions \ E \ p \ F \ f
   \langle proof \rangle
```

8 The norm of a function

 $\begin{array}{l} \textbf{theory} \ \textit{Function-Norm} \\ \textbf{imports} \ \textit{Normed-Space} \ \textit{Function-Order} \\ \textbf{begin} \end{array}$

end

8.1 Continuous linear forms

A linear form f on a normed vector space $(V, \|\cdot\|)$ is *continuous*, iff it is bounded, i.e.

$$\exists\, c\in R.\ \forall\, x\in \mathit{V}.\ |f\,x|\,\leq\, c\,\cdot\,\|x\|$$

In our application no other functions than linear forms are considered, so we can define continuous linear forms as bounded linear forms:

```
 \begin{array}{l} \textbf{locale} \ continuous = linear form + \\ \textbf{fixes} \ norm :: \textbf{-} \Rightarrow real \quad (\|\textbf{-}\|) \\ \textbf{assumes} \ bounded : \exists \ c. \ \forall \ x \in V. \ |f \ x| \leq c * \|x\| \\ \end{array}
```

declare continuous.intro [intro?] continuous-axioms.intro [intro?]

```
lemma continuous I [intro]:
fixes norm :: - \Rightarrow real (\|-\|)
assumes linear form \ V \ f
assumes r: \bigwedge x. \ x \in V \Longrightarrow |f \ x| \le c * \|x\|
shows continuous \ V \ f \ norm
\langle proof \rangle
```

8.2 The norm of a linear form

The least real number c for which holds

$$\forall x \in V. |f x| \leq c \cdot ||x||$$

is called the norm of f.

For non-trivial vector spaces $V \neq \{\theta\}$ the norm can be defined as

$$||f|| = \sup x \neq 0. ||fx|| / ||x||$$

For the case $V = \{\theta\}$ the supremum would be taken from an empty set. Since \mathbb{R} is unbounded, there would be no supremum. To avoid this situation it must be guaranteed that there is an element in this set. This element must be $\{\} \geq \theta$ so that fn-norm has the norm properties. Furthermore it does not have to change the norm in all other cases, so it must be θ , as all other elements are $\{\} \geq \theta$.

Thus we define the set B where the supremum is taken from as follows:

$$\{0\} \cup \{|fx| / ||x||. x \neq 0 \land x \in F\}$$

fn-norm is equal to the supremum of B, if the supremum exists (otherwise it is undefined).

```
locale fn\text{-}norm =  fixes norm :: - \Rightarrow real \quad (\|-\|) fixes B defines B \ V \ f \equiv \{0\} \cup \{|f \ x| \ / \ \|x\| \ | \ x. \ x \neq 0 \ \land \ x \in V\} fixes fn\text{-}norm \ (\|-\|-- \ [0, \ 1000] \ 999) defines \|f\|-V \equiv \bigcup (B \ V \ f)
```

 ${f locale}\ normed\mbox{-}vectorspace\mbox{-}with\mbox{-}fn\mbox{-}norm\mbox{=}normed\mbox{-}vectorspace\mbox{+}fn\mbox{-}norm$

```
lemma (in fn-norm) B-not-empty [intro]: 0 \in B \ V f \ \langle proof \rangle
```

The following lemma states that every continuous linear form on a normed space $(V, \|\cdot\|)$ has a function norm.

 $\mathbf{lemma} \ (\mathbf{in} \ \mathit{normed-vectorspace-with-fn-norm}) \ \mathit{fn-norm-works} :$

```
assumes continuous\ V\ f\ norm
 shows lub (B V f) (||f||-V)
\langle proof \rangle
lemma (in normed-vectorspace-with-fn-norm) fn-norm-ub [iff?]:
 assumes continuous V f norm
 assumes b: b \in B \ V f
  shows b \leq ||f|| - V
\langle proof \rangle
\mathbf{lemma} \ (\mathbf{in} \ normed\text{-}vectorspace\text{-}with\text{-}fn\text{-}norm) \ fn\text{-}norm\text{-}leastB} :
  assumes continuous\ V\ f\ norm
 assumes b: \bigwedge b. b \in B \ V f \Longrightarrow b \le y
  shows ||f|| - V \leq y
\langle proof \rangle
The norm of a continuous function is always \geq 0.
lemma (in normed-vectorspace-with-fn-norm) fn-norm-ge-zero [iff]:
 assumes continuous \ V \ f \ norm
  shows 0 \le ||f|| - V
\langle proof \rangle
```

The fundamental property of function norms is:

$$|f x| \le ||f|| \cdot ||x||$$

```
lemma (in normed-vectorspace-with-fn-norm) fn-norm-le-cong: assumes continuous Vf norm linearform Vf assumes x: x \in V shows |f x| \leq ||f|| - V * ||x|| \langle proof \rangle
```

The function norm is the least positive real number for which the following inequality holds:

$$|f x| \le c \cdot ||x||$$

```
 \begin{array}{l} \textbf{lemma (in } normed\text{-}vectorspace\text{-}with\text{-}fn\text{-}norm) } \ fn\text{-}norm\text{-}least } \ [intro?]: \\ \textbf{assumes } continuous \ V \ f \ norm \\ \textbf{assumes } ineq: \bigwedge x. \ x \in V \Longrightarrow |f \ x| \leq c * \|x\| \ \textbf{and } ge: \ \theta \leq c \\ \textbf{shows } \|f\|\text{-}V \leq c \\ \langle proof \rangle \\ \end{array}
```

end

9 Zorn's Lemma

theory Zorn-Lemma imports Main begin

Zorn's Lemmas states: if every linear ordered subset of an ordered set S has an upper bound in S, then there exists a maximal element in S. In our application,

S is a set of sets ordered by set inclusion. Since the union of a chain of sets is an upper bound for all elements of the chain, the conditions of Zorn's lemma can be modified: if S is non-empty, it suffices to show that for every non-empty chain c in S the union of c also lies in S.

```
\begin{array}{l} \textbf{theorem} \ \ Zorn's\text{-}Lemma: \\ \textbf{assumes} \ \ r: \ \bigwedge c. \ \ c \in chains \ S \Longrightarrow \exists \ x. \ \ x \in c \Longrightarrow \bigcup c \in S \\ \textbf{and} \ \ aS: \ \ a \in S \\ \textbf{shows} \ \exists \ y \in S. \ \forall \ z \in S. \ \ y \subseteq z \longrightarrow z = y \\ \langle proof \rangle \\ \\ \textbf{end} \end{array}
```

Lemmas for the Proof

10 The supremum wrt. the function order

```
theory Hahn-Banach-Sup-Lemmas
imports Function-Norm Zorn-Lemma
begin
```

This section contains some lemmas that will be used in the proof of the Hahn-Banach Theorem. In this section the following context is presumed. Let E be a real vector space with a seminorm p on E. F is a subspace of E and f a linear form on F. We consider a chain c of norm-preserving extensions of f, such that $\bigcup c = \operatorname{graph} H h$. We will show some properties about the limit function h, i.e. the supremum of the chain c.

Let c be a chain of norm-preserving extensions of the function f and let $graph\ H$ h be the supremum of c. Every element in H is member of one of the elements of the chain.

```
lemmas [dest?] = chainsD

lemmas chainsE2 [elim?] = chainsD2 [elim-format]

lemma some-H'h't:

assumes M: M = norm-pres-extensions <math>E \ p \ F f

and cM: c \in chains \ M

and u: graph \ H \ h = \bigcup c

and x: x \in H

shows \exists H' \ h'. graph \ H' \ h' \in c

\land (x, h \ x) \in graph \ H' \ h'

\land linearform \ H' \ h' \land H' \unlhd E

\land F \unlhd H' \land graph \ F \ f \subseteq graph \ H' \ h'

\land (\forall x \in H'. \ h' \ x \le p \ x)

\langle proof \rangle
```

Let c be a chain of norm-preserving extensions of the function f and let graph H h be the supremum of c. Every element in the domain H of the supremum function is member of the domain H' of some function h', such that h extends h'.

```
lemma some-H'h':

assumes M: M = norm-pres-extensions E p F f
and cM: c \in chains M
and u: graph H h = \bigcup c
and x: x \in H
shows \exists H' h'. x \in H' \land graph H' h' \subseteq graph H h
\land linearform H' h' \land H' \subseteq E \land F \subseteq H'
\land graph F f \subseteq graph H' h' \land (\forall x \in H'. h' x \subseteq p x)
\langle proof \rangle
```

Any two elements x and y in the domain H of the supremum function h are both in the domain H' of some function h', such that h extends h'.

```
lemma some-H'h'2:
assumes M: M = norm-pres-extensions E \ p \ F \ f
and cM: c \in chains \ M
and u: graph \ H \ h = \bigcup c
and x: x \in H
and y: y \in H
shows \exists \ H' \ h'. \ x \in H' \land y \in H'
\land graph \ H' \ h' \subseteq graph \ H \ h
\land linearform \ H' \ h' \land H' \trianglelefteq E \land F \trianglelefteq H'
\land graph \ F \ f \subseteq graph \ H' \ h' \land (\forall \ x \in H'. \ h' \ x \le p \ x)
\langle proof \rangle
```

The relation induced by the graph of the supremum of a chain c is definite, i.e. it is the graph of a function.

```
lemma sup-definite:

assumes M-def: M = norm-pres-extensions E p F f

and cM: c \in chains M

and xy: (x, y) \in \bigcup c

and xz: (x, z) \in \bigcup c

shows z = y

\langle proof \rangle
```

The limit function h is linear. Every element x in the domain of h is in the domain of a function h' in the chain of norm preserving extensions. Furthermore, h is an extension of h' so the function values of x are identical for h' and h. Finally, the function h' is linear by construction of M.

```
lemma sup-lf:
assumes M: M = norm-pres-extensions <math>E p F f
and cM: c \in chains M
and u: graph H h = \bigcup c
shows linearform H h
```

The limit of a non-empty chain of norm preserving extensions of f is an extension of f, since every element of the chain is an extension of f and the supremum is an extension for every element of the chain.

```
lemma sup\text{-}ext:

assumes graph: graph\ H\ h = \bigcup c

and M: M = norm\text{-}pres\text{-}extensions\ E\ p\ F\ f

and cM: c \in chains\ M

and ex: \exists\ x.\ x \in c

shows graph\ F\ f \subseteq graph\ H\ h

\langle proof \rangle
```

The domain H of the limit function is a superspace of F, since F is a subset of H. The existence of the θ element in F and the closure properties follow from the fact that F is a vector space.

```
lemma sup-supF:

assumes graph: graph H h = \bigcup c

and M: M = norm-pres-extensions E p F f
```

```
and cM: c \in chains M
and ex: \exists x. \ x \in c
and FE: F \subseteq E
shows F \subseteq H
```

The domain H of the limit function is a subspace of E.

```
lemma sup\text{-}subE:

assumes graph: graph\ H\ h = \bigcup c

and M: M = norm\text{-}pres\text{-}extensions\ E\ p\ F\ f

and cM: c \in chains\ M

and ex: \exists\ x.\ x \in c

and FE: F \trianglelefteq E

and E: vectorspace\ E

shows H \trianglelefteq E

\langle proof \rangle
```

The limit function is bounded by the norm p as well, since all elements in the chain are bounded by p.

```
lemma sup\text{-}norm\text{-}pres:

assumes graph: graph \ H \ h = \bigcup c

and M: M = norm\text{-}pres\text{-}extensions \ E \ p \ F \ f

and cM: c \in chains \ M

shows \forall \ x \in H. h \ x \le p \ x

\langle proof \rangle
```

The following lemma is a property of linear forms on real vector spaces. It will be used for the lemma *abs-Hahn-Banach* (see page 24). For real vector spaces the following inequality are equivalent:

```
\forall x \in H. |h x| \le p x and \forall x \in H. h x \le p x
```

```
lemma abs-ineq-iff: assumes subspace H E and vectorspace E and seminorm E p and linearform H h shows (\forall x \in H. |h| x| \leq p|x) = (\forall x \in H. |h| x \leq p|x) (is ?L = ?R) \langle proof \rangle
```

11 Extending non-maximal functions

```
\begin{array}{l} \textbf{theory} \ \textit{Hahn-Banach-Ext-Lemmas} \\ \textbf{imports} \ \textit{Function-Norm} \\ \textbf{begin} \end{array}
```

end

In this section the following context is presumed. Let E be a real vector space with a seminorm q on E. F is a subspace of E and f a linear function on F. We consider a subspace H of E that is a superspace of F and a linear form h on H. H is a not equal to E and x_0 is an element in E - H. H is extended to the direct sum $H' = H + lin x_0$, so for any $x \in H'$ the decomposition of $x = y + lin x_0$

 $a \cdot x$ with $y \in H$ is unique. h' is defined on H' by $h' x = h y + a \cdot \xi$ for a certain ξ .

Subsequently we show some properties of this extension h' of h.

This lemma will be used to show the existence of a linear extension of f (see page ??). It is a consequence of the completeness of \mathbb{R} . To show

$$\exists \xi. \ \forall y \in F. \ a \ y \leq \xi \land \xi \leq b \ y$$

it suffices to show that

$$\forall u \in F. \ \forall v \in F. \ a \ u \leq b \ v$$

```
\begin{array}{l} \textbf{lemma} \ \textit{ex-xi:} \\ \textbf{assumes} \ \textit{vectorspace} \ F \\ \textbf{assumes} \ \textit{r:} \ \bigwedge \textit{u} \ \textit{v.} \ \textit{u} \in \textit{F} \Longrightarrow \textit{v} \in \textit{F} \Longrightarrow \textit{a} \ \textit{u} \leq \textit{b} \ \textit{v} \\ \textbf{shows} \ \exists \textit{xi::real.} \ \forall \textit{y} \in \textit{F.} \ \textit{a} \ \textit{y} \leq \textit{xi} \ \land \textit{xi} \leq \textit{b} \ \textit{y} \end{array}
```

The function h' is defined as a h' x = h $y + a \cdot \xi$ where $x = y + a \cdot \xi$ is a linear extension of h to H'.

```
lemma h'-lf:
```

 $\langle proof \rangle$

```
assumes h'-def: \bigwedge x. h' x = (let (y, a) = SOME (y, a). x = y + a \cdot x0 \land y \in H in h y + a * xi) and H'-def: H' = H + lin x0 and HE: H \leq E assumes linearform H h assumes x0: x0 \notin H x0 \in E x0 \neq 0 assumes E: vectorspace E shows linearform H' h' \langle proof \rangle
```

The linear extension h' of h is bounded by the seminorm p.

```
lemma h'-norm-pres:
```

```
assumes h'-def: \bigwedge x. h' x = (let (y, a) = SOME (y, a). x = y + a \cdot x0 \land y \in H in h y + a * xi) and H'-def: H' = H + lin x0 and x0: x0 \notin H x0 \in E x0 \neq 0 assumes E: vectorspace E and HE: subspace H E and seminorm E p and linearform H h assumes a: \forall y \in H. h y \leq p y and a': \forall y \in H. -p (y + x0) - h y \leq xi \land xi \leq p (y + x0) - h y shows \forall x \in H'. h' x \leq p x
```

 \mathbf{end}

Part III

The Main Proof

12 The Hahn-Banach Theorem

theory Hahn-Banach imports Hahn-Banach-Lemmas begin

We present the proof of two different versions of the Hahn-Banach Theorem, closely following [1, §36].

12.1 The Hahn-Banach Theorem for vector spaces

Hahn-Banach Theorem. Let F be a subspace of a real vector space E, let p be a semi-norm on E, and f be a linear form defined on F such that f is bounded by p, i.e. $\forall x \in F$. $f x \leq p x$. Then f can be extended to a linear form h on E such that h is norm-preserving, i.e. h is also bounded by p.

Proof Sketch.

- 1. Define M as the set of norm-preserving extensions of f to subspaces of E. The linear forms in M are ordered by domain extension.
- 2. We show that every non-empty chain in M has an upper bound in M.
- 3. With Zorn's Lemma we conclude that there is a maximal function g in M.
- 4. The domain H of g is the whole space E, as shown by classical contradiction:
 - Assuming g is not defined on whole E, it can still be extended in a norm-preserving way to a super-space H' of H.
 - Thus g can not be maximal. Contradiction!

theorem Hahn-Banach:

```
assumes E: vectorspace E and subspace F E and seminorm E p and linearform F f assumes fp: \forall x \in F. f x \leq p x shows \exists h. linearform E h \land (\forall x \in F, h \ x = f \ x) \land (\forall x \in E, h \ x \leq p \ x) — Let E be a vector space, F a subspace of E, p a seminorm on E, — and f a linear form on F such that f is bounded by p, — then f can be extended to a linear form h on E in a norm-preserving way. \langle proof \rangle
```

12.2 Alternative formulation

The following alternative formulation of the Hahn-Banach Theorem uses the fact that for a real linear form f and a seminorm p the following inequality are equivalent:¹

 $^{^{1}}$ This was shown in lemma abs-ineq-iff (see page 22).

```
\forall x \in H. |h x| \le p x and \forall x \in H. h x \le p x
```

```
theorem abs-Hahn-Banach: assumes E: vectorspace E and FE: subspace F E and lf: linearform F f and sn: seminorm E p assumes fp: \forall x \in F. |f|x| \leq p x shows \exists g. linearform E g \land (\forall x \in F. \ g|x| \leq p|x) \land (\forall x \in E. \ |g|x| \leq p|x)
```

12.3 The Hahn-Banach Theorem for normed spaces

Every continuous linear form f on a subspace F of a norm space E, can be extended to a continuous linear form g on E such that ||f|| = ||g||.

```
theorem norm-Hahn-Banach: fixes V and norm (\|\cdot\|) fixes B defines \bigwedge Vf. B Vf \equiv \{0\} \cup \{|fx| \ / \ ||x\| \ | \ x. \ x \neq 0 \ \land \ x \in V\} fixes fn-norm (\|\cdot\|-- [0,\ 1000]\ 999) defines \bigwedge Vf. \|f\|\cdot V \equiv \bigsqcup (B\ Vf) assumes E-norm: normed-vectorspace E norm and FE: subspace F E and linearform: linearform F f and continuous F f norm shows \exists\ g.\ linearform \ E\ g \land\ continuous\ E\ g\ norm \land\ (\forall\ x \in F.\ g\ x = f\ x) \land\ \|g\|\cdot E = \|f\|\cdot F
```
