Security in  
knowledge

***Why*** is mobile security an imperative?

***Who*** will be held accountable?

***What*** platform strategy makes sense?

***Where*** are mobile apps developed?

***How*** do we build secure mobile apps?

*Why* is mobile  
security an  
imperative?

# Mobile Devices are Taking

KPCB

# Not Just for Consumers

▶ By 2015, mobile dev projects targeting smartphones and tablets will outnumber native PC projects by a ratio of 4:1

– Gartner 7/12

▶ By 2016, > 50 percent of enterprise email users will rely primarily web or mobile.

–  
Gartner 12/11

*Who* will be held  
accountable?

# What is Mobile?

device

server

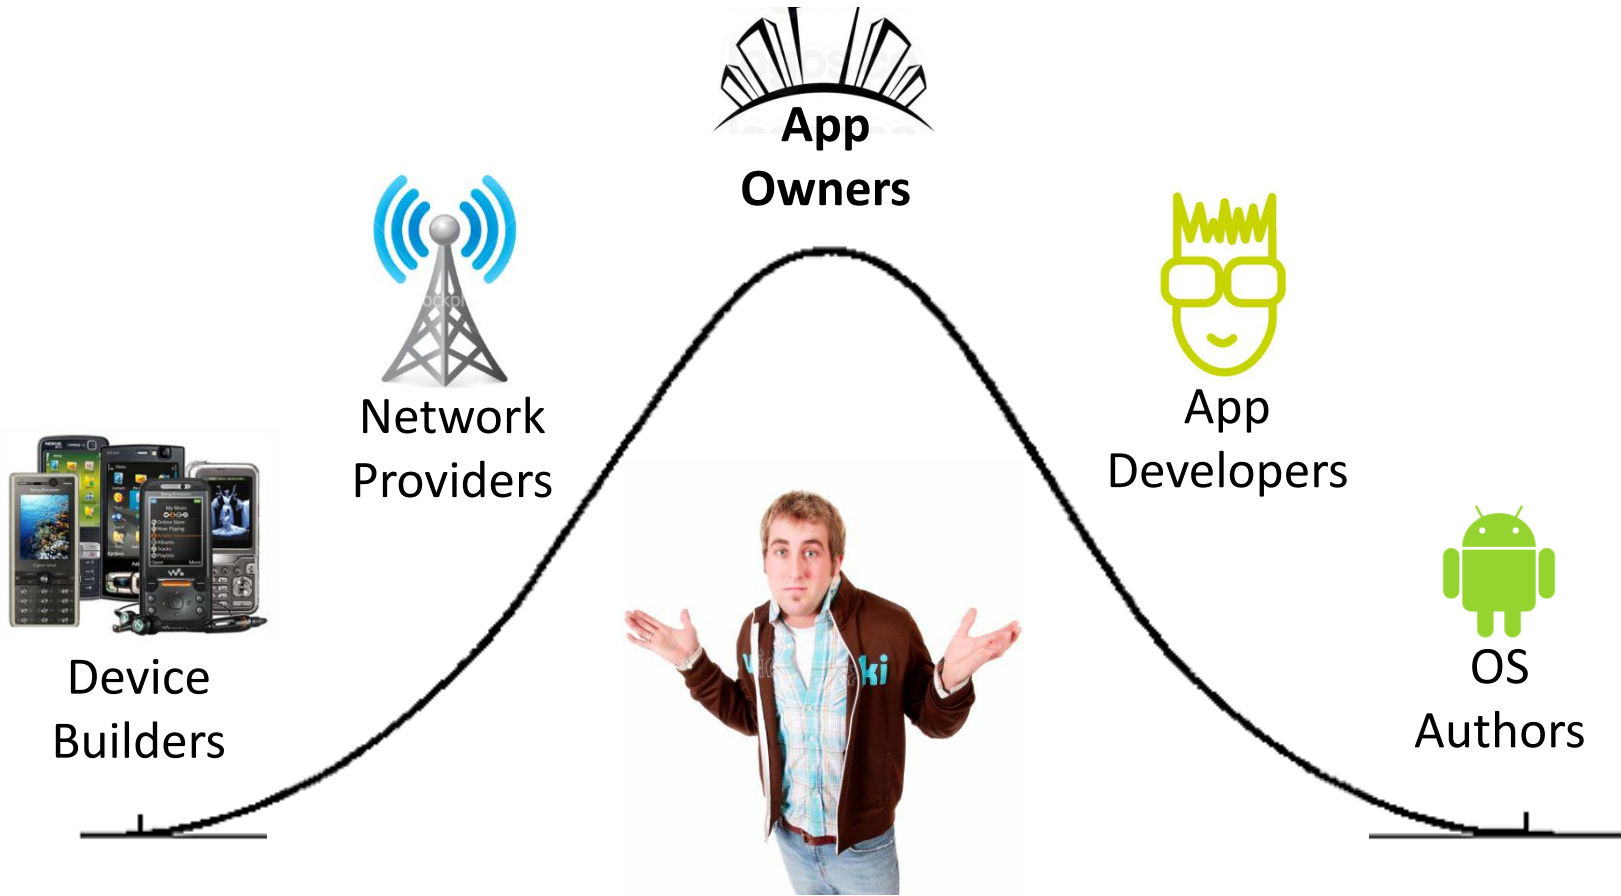

apps

OS

# Who Cares?

**Who Will Users Hold Accountable?**

*What* platform  
strategy makes  
sense?

# Platform Tradeoffs

- ▶ Web, native, hybrid
- ▶ Operating systems
- ▶ Developer support
- ▶ Application delivery
- ▶ Programming language

# Web Versus Native

- ▶ Native mobile applications
  - ▶ Persistent
  - ▶ Hardware support
  - ▶ Flexible
- ▶ Mobile-optimized web apps
  - ▶ Lightweight
  - ▶ Multi-platform
  - ▶ Bolt onto legacy apps
- ▶ Hybrid?
  - ▶ Native container for web content
  - ▶ Cross-compiled native apps

80% by 2015  
– Gartner 11/12

# — Application Delivery

- ▶ Open app store model (Google Marketplace)
  - ▶ Enterprise app stores
  - ▶ Security as a differentiator
  - ▶ Researcher access?
- ▶ Closed app store model (Apple App Store)
  - ▶ Controlled ecosystem
  - ▶ Revocation capability
  - ▶ Compromise: Apple's iOS Developer Enterprise Program

# Native Programming Languages

- ▶ Objective-C
  - ▶ Little-known pre-iOS
  - ▶ 'Unsafe' language
  - ▶ Limited tool support
  
- ▶ Java
  - ▶ Widely-known
  - ▶ No more buffer overflows
  - ▶ Better tool support

*Where* are mobile apps developed?

# — Mobile Development

- ▶ In-house
- ▶ Traditional outsourcers
- ▶ Boutique firms

# — In-House Development

## Pros

- ▶ Leverage investments
- ▶ Easier integration
- ▶ Control over full SDLC

## Cons

- ▶ Must train resources
- ▶ Add-ons may add risk
- ▶ Hard to outsource security

# — Traditional Outsourcers

## Pros

- ▶ Well-known expectations
- ▶ Expand on experience
- ▶ Control over SDLC

## Cons

- ▶ Harder to find talent
- ▶ Add-ons may add risk
- ▶ Outsourcing security (but not accountability)

# Boutique Firms

## Pros

- ▶ Specialized talent
- ▶ Accelerated delivery
- ▶ Low-investment for high-quality result

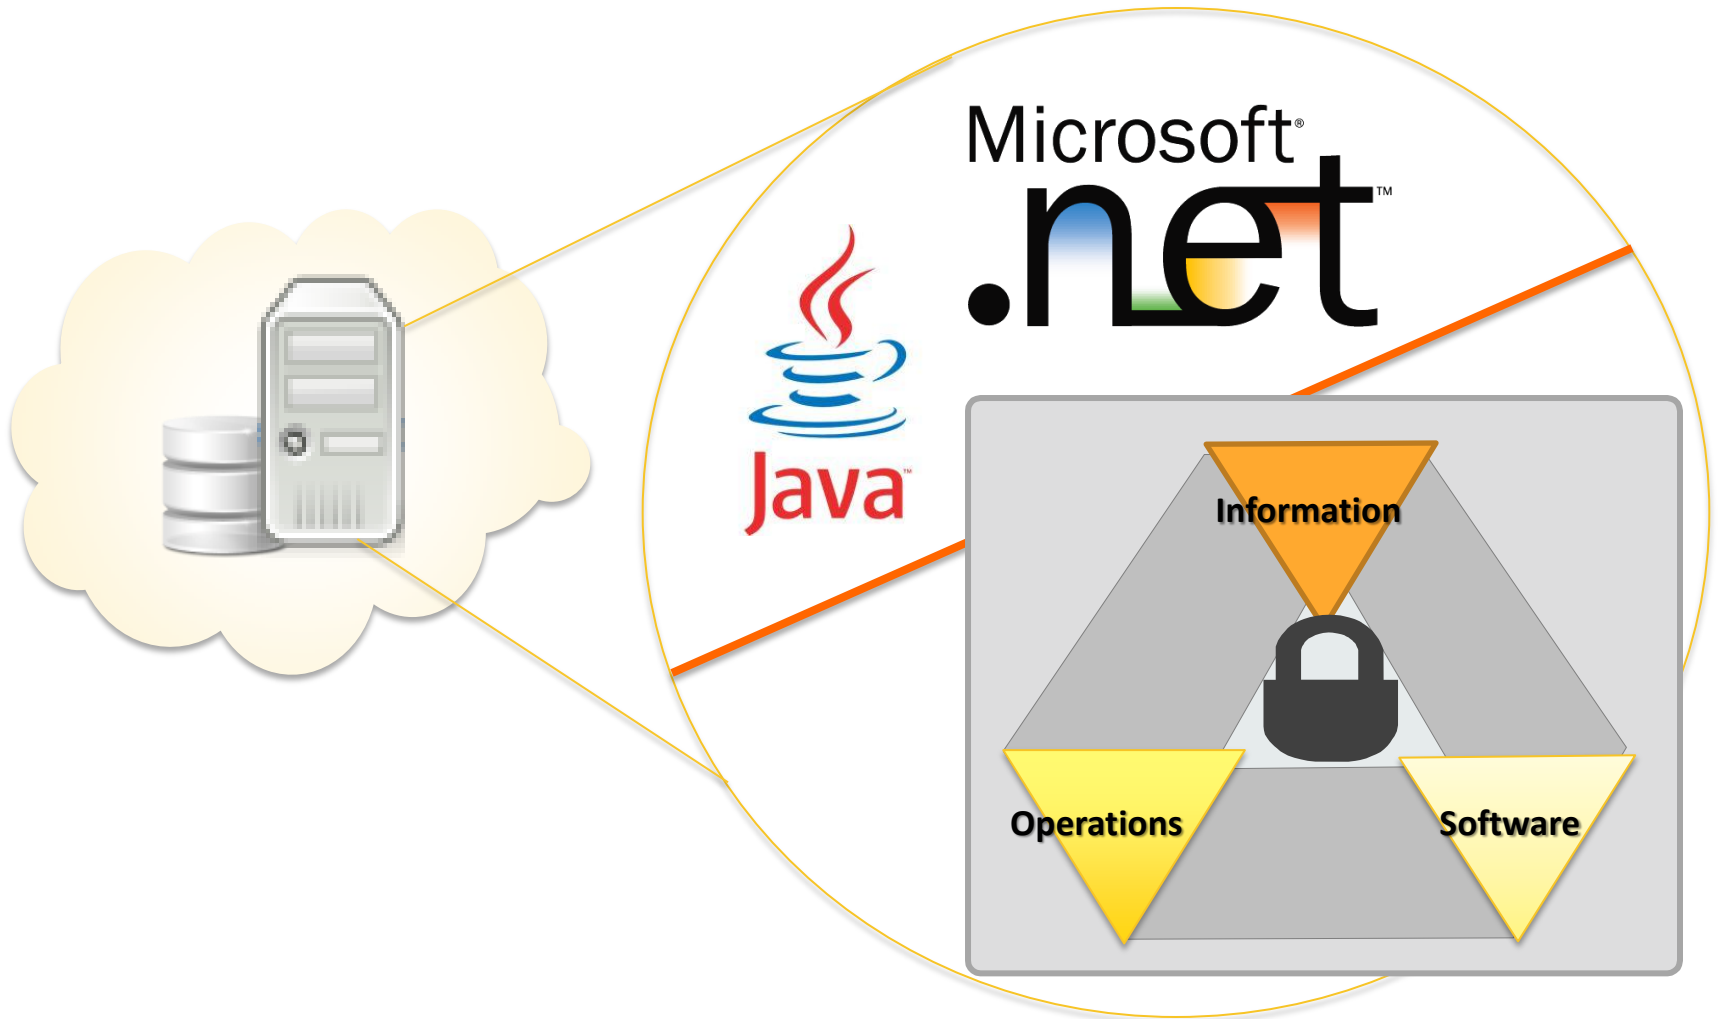

## Cons

- ▶ Lack of security maturity
- ▶ Difficult integration
- ▶ Little influence over SDLC

*How* do we build  
secure mobile apps?

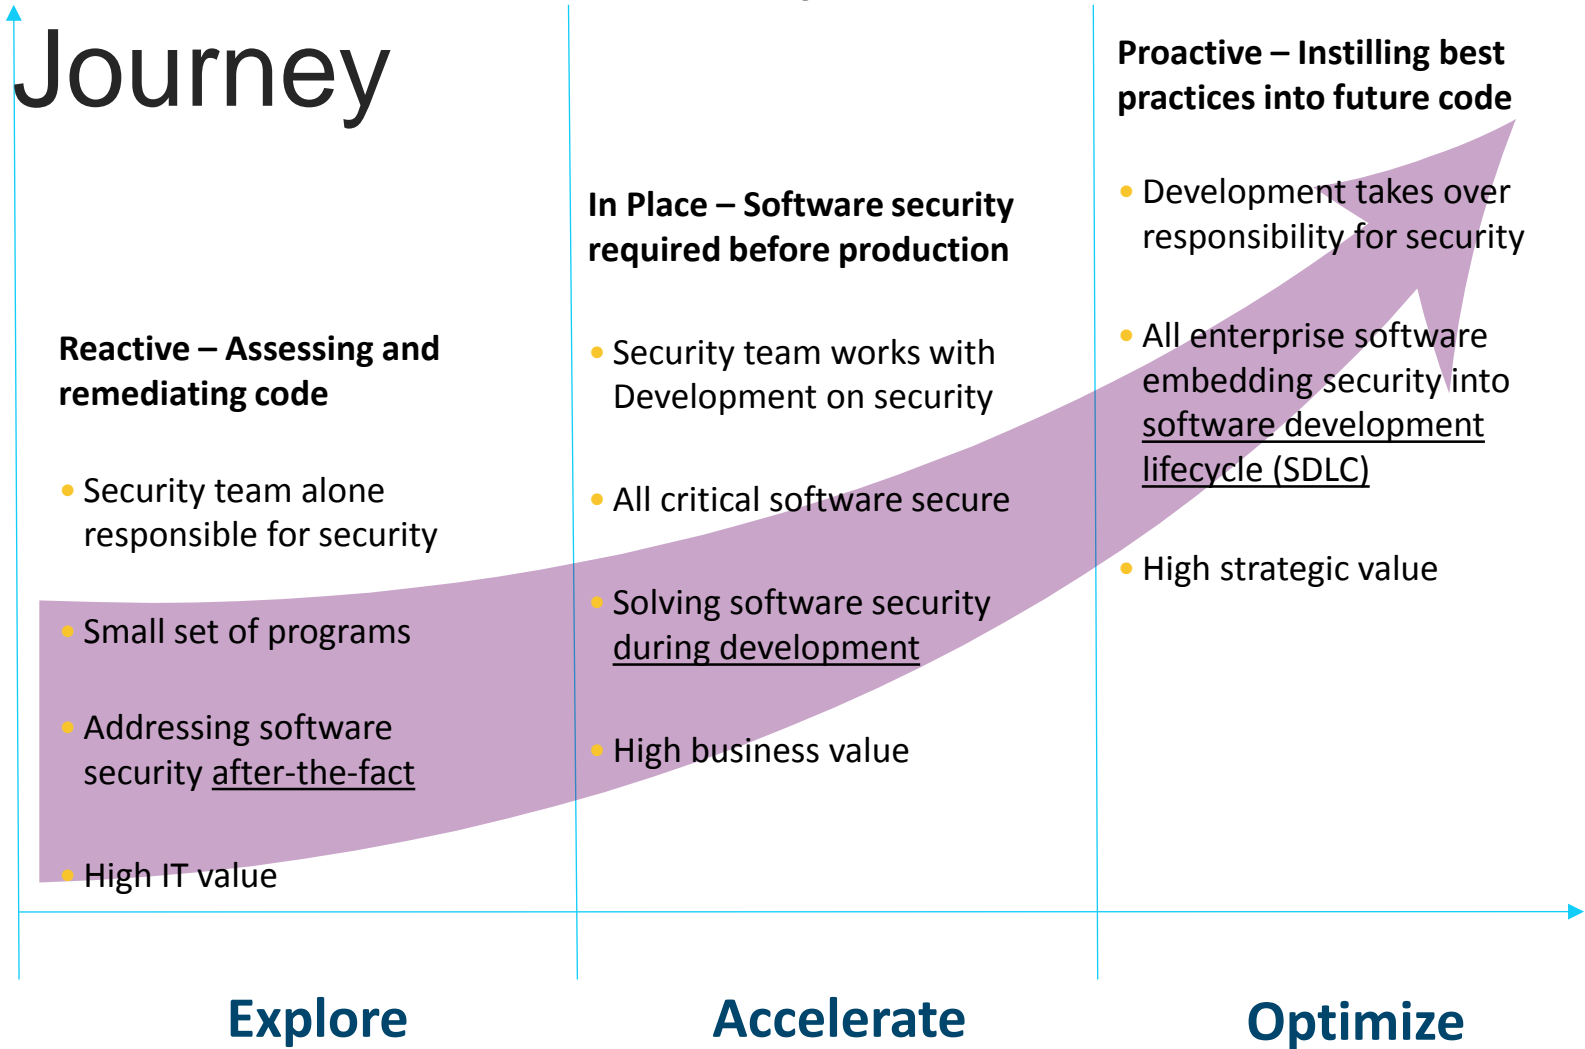

# Same Ol' Server

# Software Security Assurance

## Journey

# — Inspiration from the Industry: BSIMM4

- ▶ Real data from (51) real initiatives
- ▶ 95 measurements
- ▶ 13 repeat measurements
- ▶ McGraw, Miguez, & West

# Parting Thoughts

# — More Questions to Ask

- ▶ What do your apps do and for whom?
- ▶ What platform(s) do your apps support and how?
- ▶ Who develops your apps and where?
- ▶ Is there an existing SDL for other development?
- ▶ Do you rely on platform providers or app distributors for any security assurance?
- ▶ Are mobile apps prompting back-end changes?
