

Who, What, Where, How: Five Big Questions in Mobile Security

Security in
knowledge

Jacob West
CTO, Fortify Products
HP Enterprise Security

Why is mobile security an imperative?

Who will be held accountable?

What platform strategy makes sense?

Where are mobile apps developed?

How do we build secure mobile apps?

Why is mobile security an imperative?

Mobile Devices are Taking

Why Mobile Users Don't Buy

▶ Security is #2 reason to avoid purchases

Source: Google/MMA, Global Perspectives: The Smartphone User & Mobile Marketer, June 2011
 Base: Smartphone Users (US: 6000; UK: 2000; FR: 2000; DE: 2000; JP: 1000).
 Base: Smartphone Users Who Have Not Made a Purchase on Device (US: 4444; UK: 1559; FR: 1653; DE: 1442; JP: 554).
 Q... Why have you not made a purchase using your smartphone?

Not Just for Consumers

- ▶ By 2016, > 50 percent of enterprise email users will rely primarily web or mobile.

Gartner 12/11

- ▶ Smartphones and tablets are more than 90 percent of the new device adoption.

Gartner 12/11

Who will be held
accountable?

What is Mobile?

device

server

apps

os

Who Cares?

Who Will Users Hold Accountable?

Lots to Lose

Device Builders

- Big price tag
- *Infrequent purchase*
- Brand loyalty

Network Providers

- Big price tag
- *Monthly fee*
- Brand loyalty

Blame Game

App Owners

- Big brand impact
- Compliance
- Maintenance costs

App Developers

- No brand impact
- No compliance
- Ever more contracts

— Decisions to Make

OS Authors

- Big risk, big reward
- Tied to delivery
- Developers versus users

What platform
strategy makes
sense?

Platform Tradeoffs

- ▶ Web, native, hybrid
- ▶ Operating systems
- ▶ Developer support
- ▶ Application delivery
- ▶ Programming language

Web Versus Native

- ▶ Native mobile applications
 - ▶ Persistent on phone
 - ▶ Deeper hardware support
 - ▶ More flexible user experience
- ▶ Mobile-optimized web apps
 - ▶ Lightweight footprint
 - ▶ Easy cross-platform model
 - ▶ Easy migration from legacy apps
- ▶ Hybrid?
 - ▶ Native container for web content
 - ▶ Cross-compiled native apps

80% by 2015
– Gartner 11/12

Working with Mobile Operating Systems

- Benefit of hindsight

- Security features
 - Read-only stack
 - Data encryption
 - Permissions

- Confusing
 - Wait, permissions?

Mobile OS Features: Can't We All Get Along?

- Formal communication
 - Inter-application
 - Intra-application
 - With the OS
- Platform differentiator
- A new trust boundary

Application Delivery

- ▶ Open app store model (Google Marketplace)
 - ▶ Enterprises stand-up their own app stores
 - ▶ Security can become an app-store differentiator
 - ▶ Researchers have better access
- ▶ Closed app store model (Apple App Store)
 - ▶ App store owner has much greater control
 - ▶ Victim exposure minimized with revocation capability
 - ▶ Compromise: Apple's iOS Developer Enterprise Program

Native Programming Languages

- ▶ Objective-C
 - ▶ Little-known until iOS
 - ▶ 'Unsafe' language makes buffer overflows a big problem
 - ▶ Limited tool support
- ▶ Java
 - ▶ Widely-known by enterprise developers
 - ▶ 'Safe' means no more buffer overflows
 - ▶ Better tool support

Where are mobile apps developed?

— Mobile Development

- ▶ In-house
- ▶ Traditional outsourcers
- ▶ Boutique mobile development firms

— In-House Development

Pros

- ▶ Leverage existing security investment
- ▶ Easier integration with legacy systems
- ▶ Control over full SDLC and artifacts

Cons

- ▶ Must train resources on new technology
- ▶ Building onto old apps may add risk
- ▶ Difficult to outsource security responsibility

— Traditional Outsourcers

Pros

- ▶ Working with well-known expectations
- ▶ Expand on experience from past contracts
- ▶ Influence over SDLC and deliverables (vs. boutique firms)

Cons

- ▶ Harder to find deeply specialized skillsets
- ▶ Building onto old apps may add risk
- ▶ Outsourcing security, but not accountability

Boutique Mobile Development Firms

Pros

- ▶ Highly-specialized skillsets for mobile
- ▶ Opportunity to accelerate delivery
- ▶ Low-investment for high-quality result

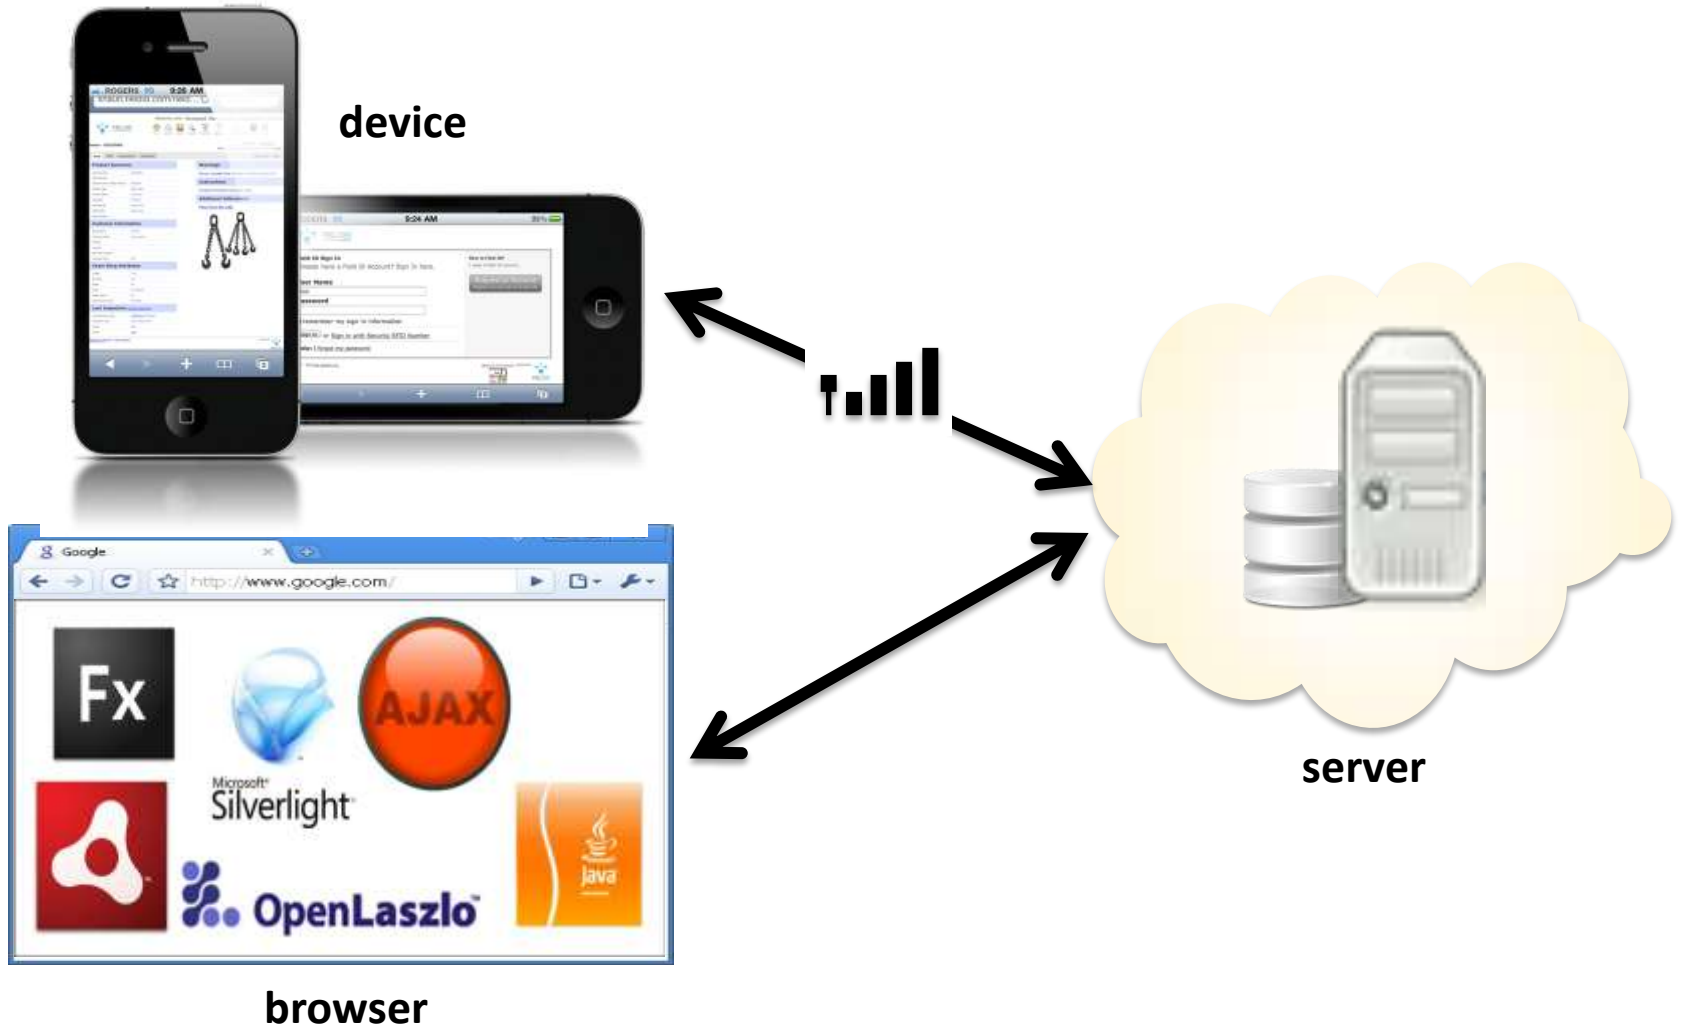

Cons

- ▶ Lack of security and engineering maturity
- ▶ Difficulty integrating with legacy systems
- ▶ Little influence over SDLC and artifacts

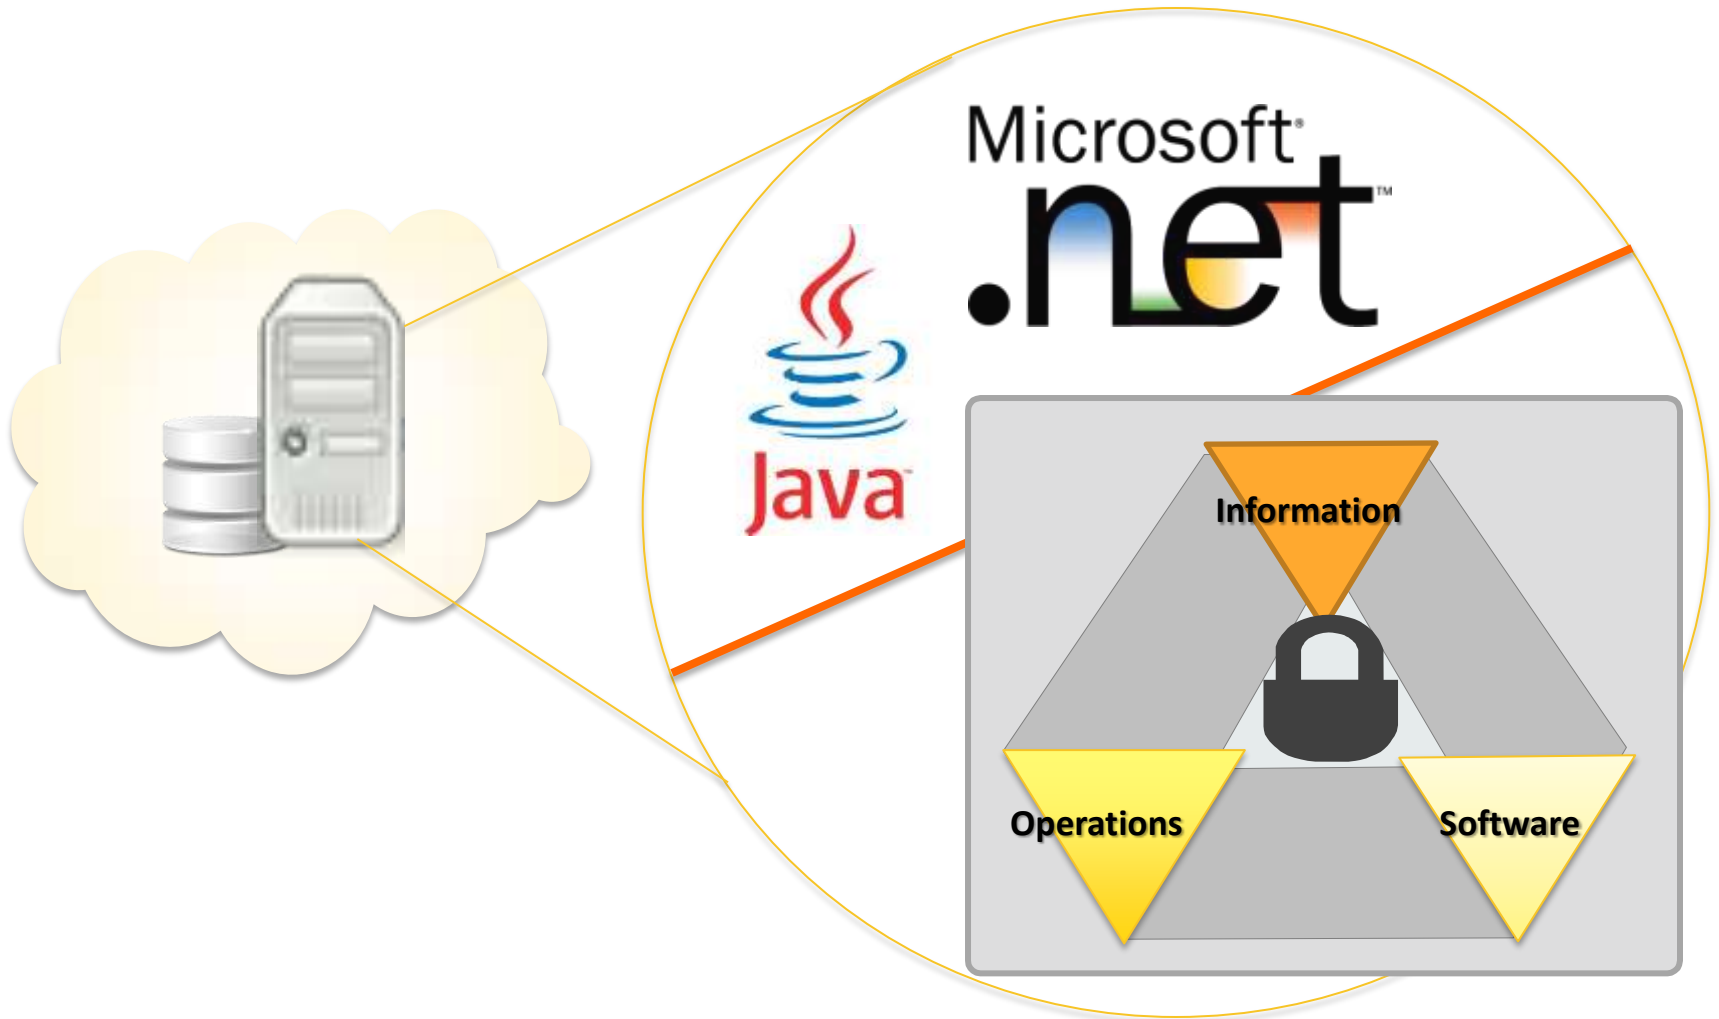

How do we build
secure mobile
apps?

Familiar Model

Same Ol' Server

— Evolving Threats

Old

- ▶ Handling sensitive user and app data
- ▶ Environment and configuration
- ▶ Standbys like XSS and SQL injection

New

- ▶ Local storage (e.g. SD card)
- ▶ Communication (SMS, MMS, GPS)
- ▶ Security features (Privileges, crypto)

Google Android App

Intent Hijacking

Intent Spoofing

Sticky
Broadcast
Tampering

Insecure
Storage

Insecure
Network
Communication

SQL Injection

Promiscuous
Privileges

Description: Unencrypted channels can be intercepted by attackers sniffing network

Cause: Non-HTTPS WebView connections

Fix: Send sensitive data only over encrypted channels

Challenges for Organizations

1

Immediate – Find & Fix

Find and **Fix** today's software vulnerabilities putting us at risk

2

Systemic

Make sure that security is built into tomorrow's software

In-house

Outsourced

Commercial

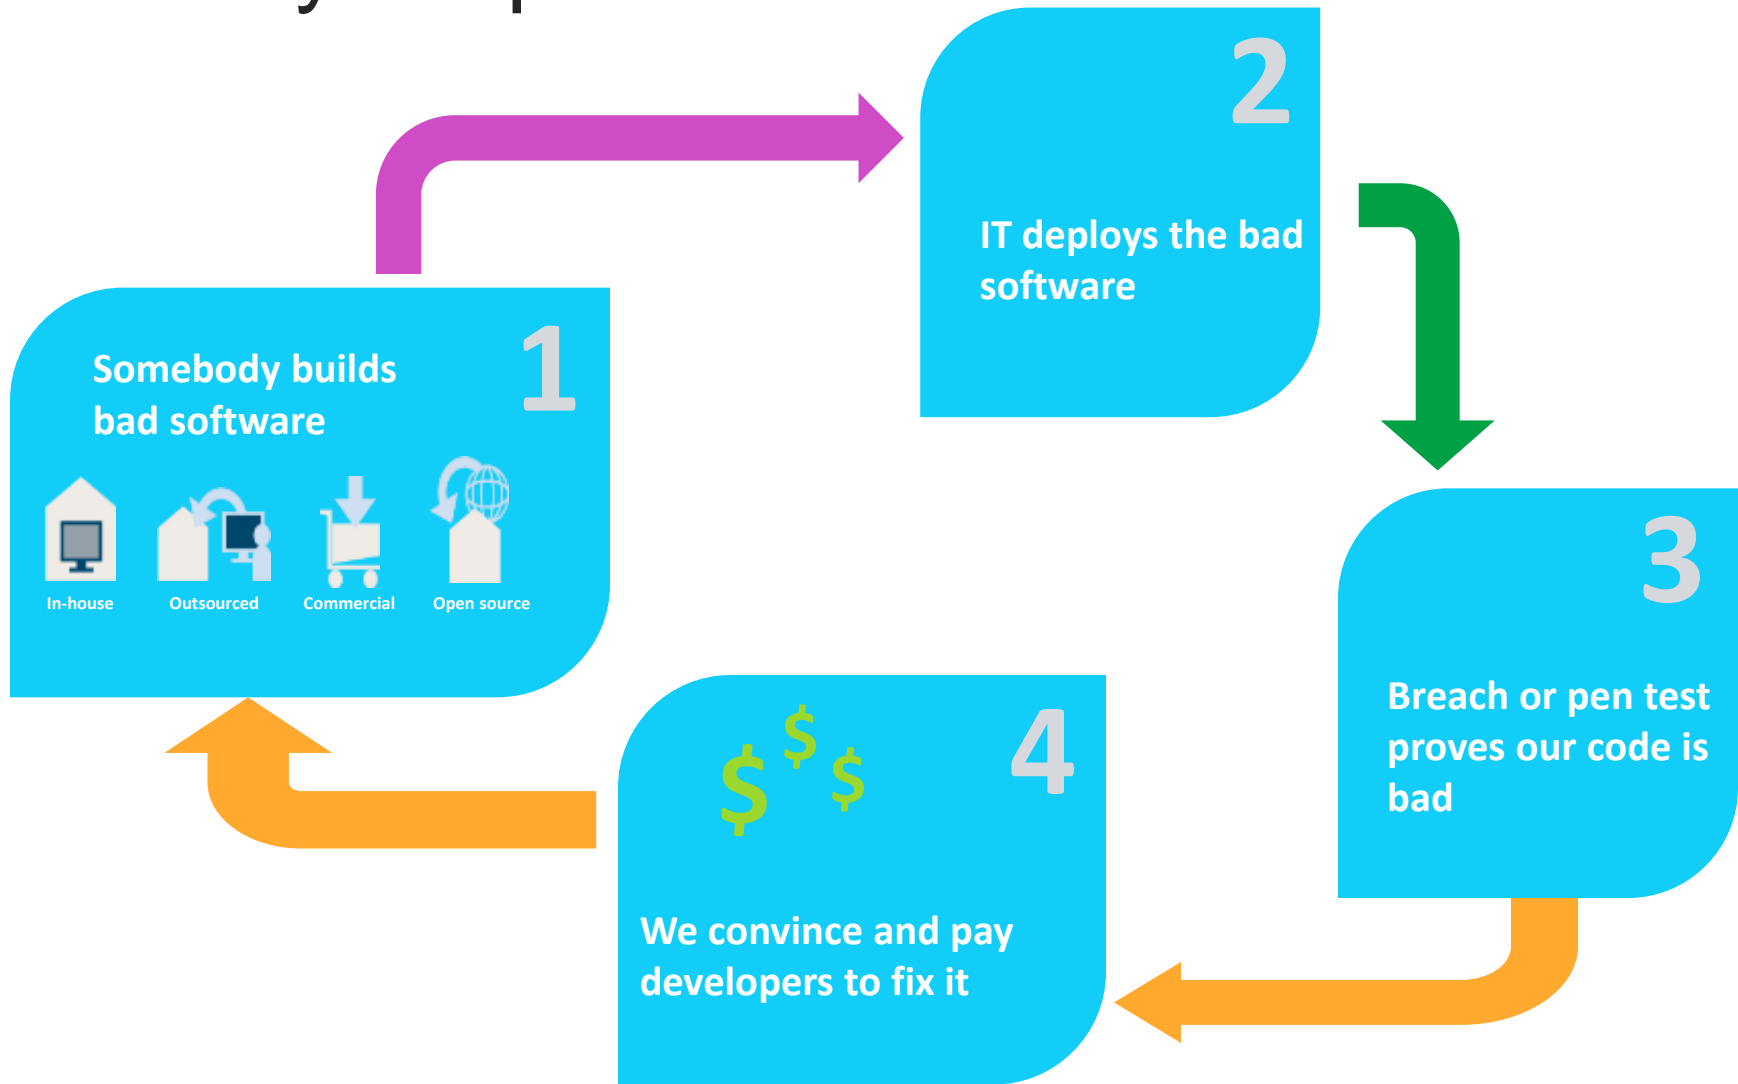

Open Source

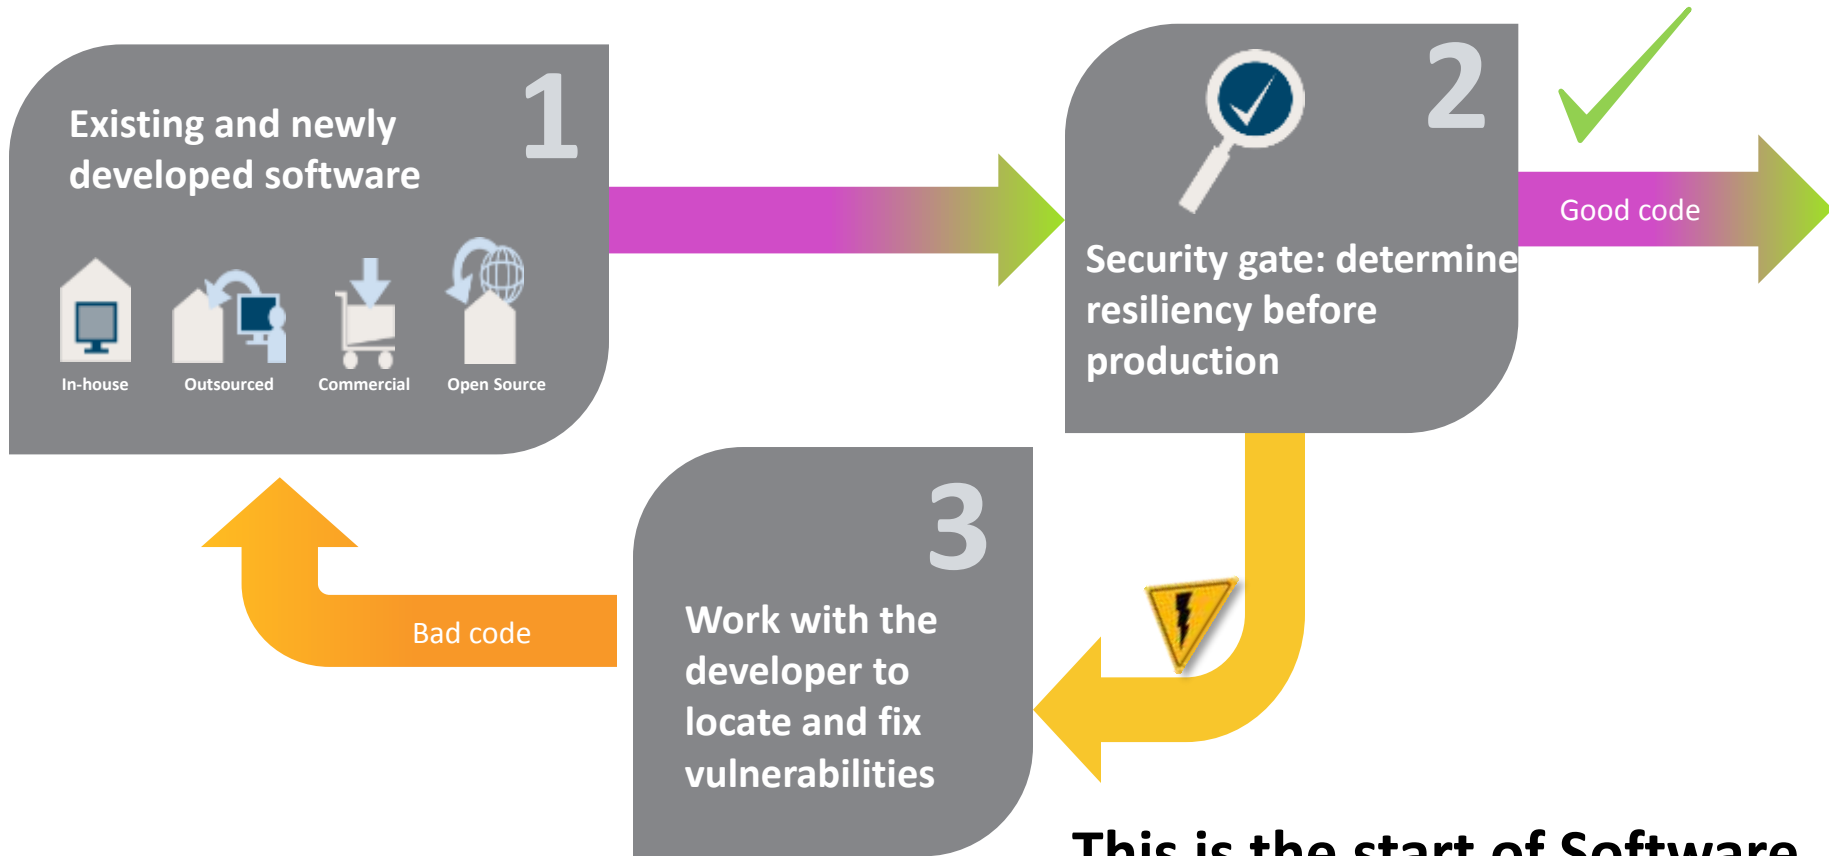

Compliance

Today: Expensive and Reactive

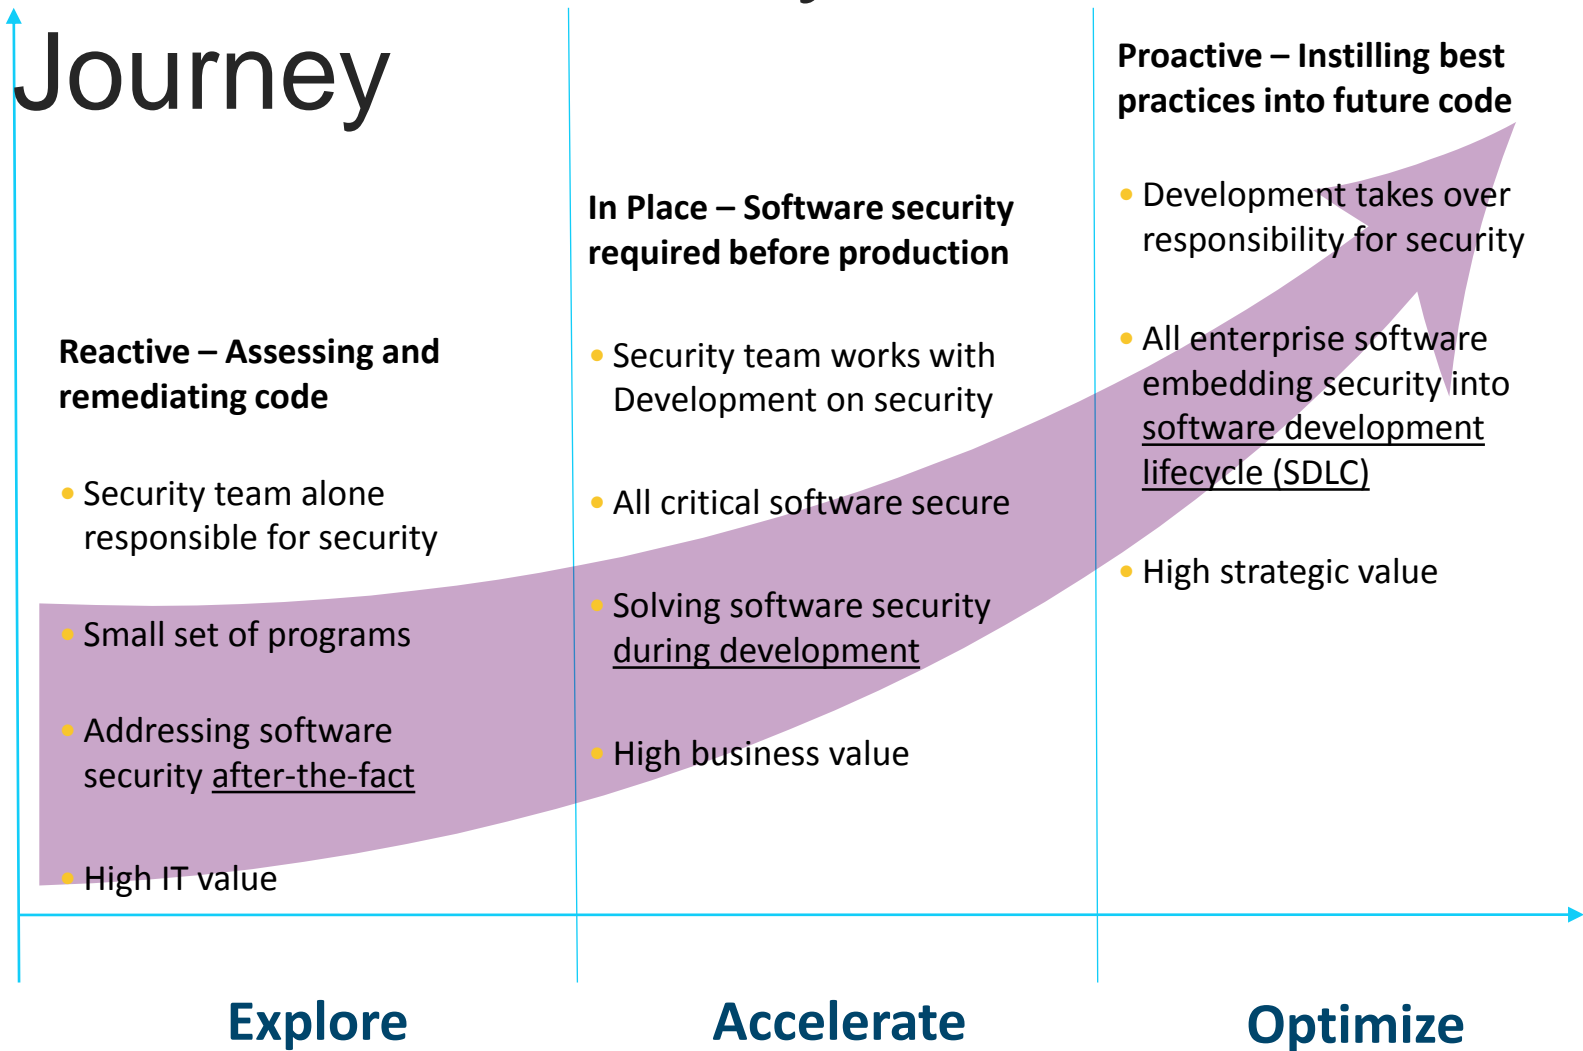

A Safer, More Effective Approach

This is the start of Software Security Assurance (SSA)

Software Security Assurance

Journey

— Inspiration from the Industry: BSIMM4

- ▶ Real data from (51) real initiatives
- ▶ 95 measurements
- ▶ 13 repeat measurements
- ▶ McGraw, Miguez, & West

www.bsimm.com

BSIMM4: Participants

Plus 17 firms
that remain
anonymous

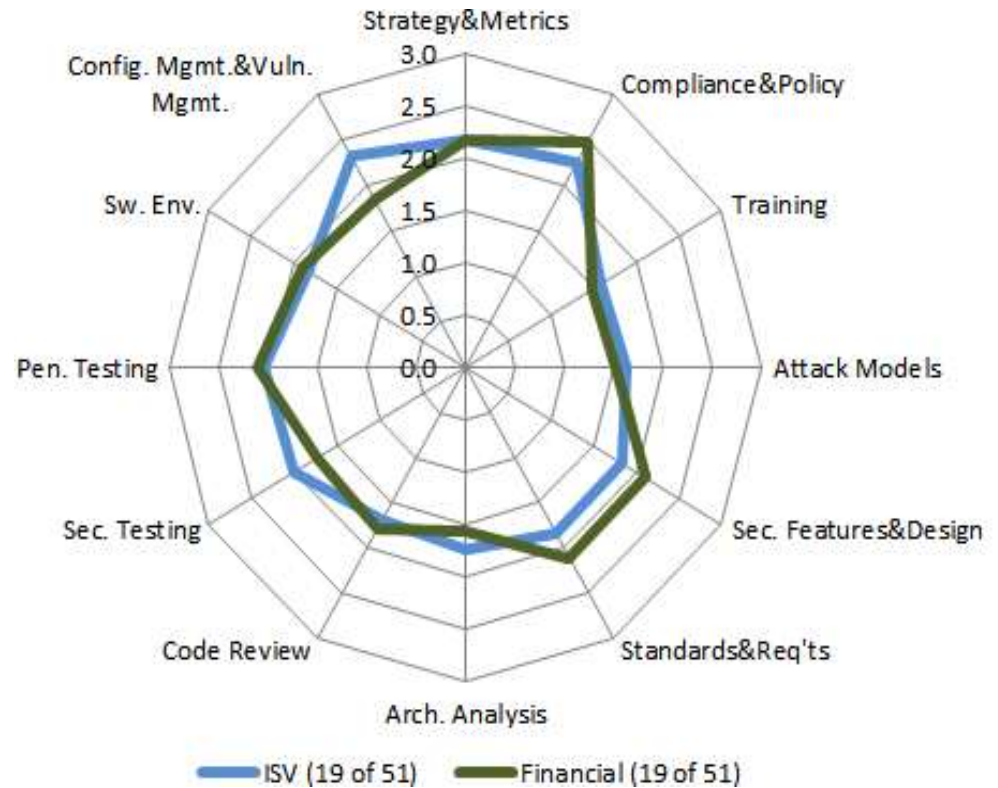

Common Activities

- Identify gates
- Know PII obligations
- Awareness training
- Data classification
- Identify features
- Security standards
- Review security features
- **Static analysis tool**
- QA boundary testing
- **External pen testers**
- Good network security
- Close ops bugs loop

No Special Snowflakes

- ▶ ISV (19) results are similar to financial services (19)
- ▶ Do the same things
- ▶ Can demand the same results
- ▶ Measurement works for all

Parting Thoughts

— What Questions to Ask?

- ▶ What do your apps do and for whom?
- ▶ What platform(s) do your apps support and how?
- ▶ Who develops your apps and where?
- ▶ Is there an existing SDL for other development?
- ▶ Do you rely on platform providers or app distributors for any security assurance?
- ▶ Are mobile apps prompting back-end changes?
- ▶ Are your apps appropriately permissioned?
