CHANGE

Challenge today's security thinking

Outline

- ◆ Motivation
- ◆ Revisit SVP Algorithms on Lattices with Gaps
- ◆ Search SVP for Some Lattice-based Cryptosystems
- ◆ Summary

RSA[®]Conference2015

San Francisco | April 20-24 | Moscone Center

Motivation

Shortest Vector Problem

- ◆ SVP: NP-Hard
 - ◆ Given a basis of a lattice, find a nonzero shortest lattice vector.
- ◆ uSVP_γ : unique-Shortest Vector Problem
 - ◆ $\lambda_2(L) > \gamma \lambda_1(L)$, find a nonzero shortest lattice vector.
- ◆ SVP algorithms
 - ◆ Deterministic: enumeration, Voronoi cell computation based...
 - ◆ Probabilistic: heuristic & **provable sieve**...

Previous Work

- ◆ Probabilistic Sieve algorithms:
 - ◆ **Heuristic:**

Algorithm	Time	Space
Nguyen, Vidick (2008)	$2^{0.415n}$	$2^{0.2075n}$
Wang, et al. (2011)	$2^{0.3836n}$	$2^{0.2557n}$
Zhang, et. al. (2013)	$2^{0.3778n}$	$2^{0.2833n}$
Becker, et. al. (2013)	$2^{0.3774n}$	$2^{0.2925n}$

Previous Work

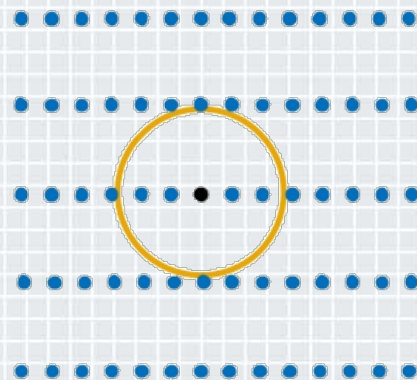

- ◆ Probabilistic Sieve algorithms:
 - ◆ **Provable:**

Algorithm	Time	Space	Reference
AKS	$2^{O(n)}$	$2^{O(n)}$	[Ajtai, et al. 2001]
Regev	2^{16n}	2^{8n}	[Regev 2004]
NV	$2^{5.9n}$	2^{3n}	[Nguyen, Vidick 2008]
ListSieve	$2^{3.199n}$	$2^{1.325n}$	[Micciancio, Voulgaris 2009]
ListSieve-Birthday	$2^{2.465n}$	$2^{1.233n}$	[Pujol, Stehlé 2009]

Motivation

- ◆ What about lattices with **gaps**?
 - ◆ Successive minima $\lambda_2(L) > \gamma\lambda_1(L)$
 - ◆ Sparse distribution
 - ◆ Complexity decreases obviously as the increase of gap
 - ◆ Common in cryptographic instances

RSA[®]Conference2015

San Francisco | April 20-24 | Moscone Center

SVP Algorithms on Lattices with Gaps

 #RSAC

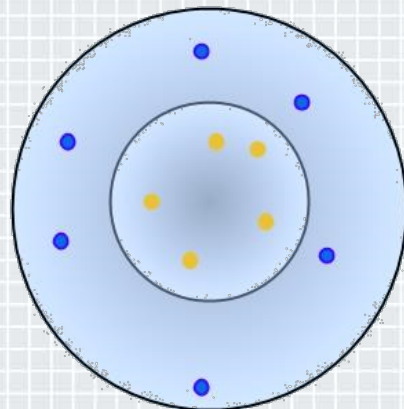

List-Sieve [MV09]

- ◆ Create a set of short vectors by subtractions.
- ◆ All previous vectors are used to reduce a new one.
- ◆ Random perturbation technique.
- ◆ Several lattice vectors might correspond to one perturbed vector.
- ◆ A collision happens with a high probability when there are enough sieved vectors.

ListSieve-Birthday[PS09]

- ◆ Apply List-Sieve, sample lattice points that fall inside of the corona which consist of the first list.
- ◆ Sample **small** and **independent** points by reducing random points with respect to the first list.
- ◆ A collision occurs with high probability.

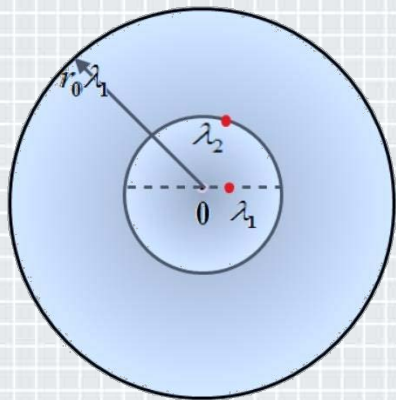

Revisit Sieve Algorithms on Lattices with Gaps

- ◆ Two cases
 - ◆ λ_2 -gap: $\lambda_2(L) > \alpha\lambda_1(L)$
 - ◆ λ_{i+1} -gap: $\lambda_{i+1}(L) > \alpha\lambda_1(L)$
- ◆ Concretely
 - ◆ **Packing density** of lattices with gaps
 - ◆ ListSieve-Birthday

Packing density of lattices with λ_2 -gap

What is the maximum number of lattice points inside a sphere with radius $r_0\lambda_1$?

- ◆ Our result: If $\lambda_2(L) > \alpha\lambda_1(L)$, then

$$|B_n(\mathbf{0}, r_0\lambda_1) \cap L| \leq 2^{c_b n + o(n)},$$

where $c_b = \log_2 r_0 - \log_2 \alpha + 0.401$ and $1 \leq \alpha \leq r_0$.

$$\mathbf{A}: \forall \mathbf{v} \neq \mathbf{u}, \|\mathbf{v} - \mathbf{u}\| \geq \alpha \lambda_1$$

$$\mathbf{B} = \{\mathbf{w}: \exists \mathbf{t} \in \mathbf{A}, \text{ s.t. } \|\mathbf{w} - \mathbf{t}\| < \alpha \lambda_1\}$$

Estimate $|A|, |B|$

◆ $|B| \leq (1 + 2\lceil\alpha\rceil)|A|$

Estimate $|A|, |B|$

◆ $|B| \leq (1 + 2\lceil\alpha\rceil)|A|$

◆ $|A| \leq 2^{(\log_2 r_0 - \log_2 \alpha + 0.401)n + o(n)}$

Estimate $|A|, |B|$

◆ $|B| \leq (1 + 2\lfloor \alpha \rfloor)|A|$

◆ $|A| \leq 2^{(\log_2 r_0 - \log_2 \alpha + 0.401)n + o(n)}$

◆ Finally, $|\mathcal{B}_n(\mathbf{0}, r_0 \lambda_1) \cap L| \leq \text{poly}(n) \cdot (|A| + |B|) \leq 2^{c_b n + o(n)}$

Complexity Analysis of ListSieve-Birthday

- ◆ Time: $2^{c_{time}n+o(n)}$, Space: $2^{c_{space}n+o(n)}$
- ◆ Minimize the time complexity,

$$c_{time} = 0.802 + \log_2\left(\frac{1}{\sqrt{1 - \frac{1}{4\xi^2}}} + \frac{2\xi}{\alpha \cdot 2^{0.401} \left(1 - \frac{1}{4\xi^2}\right)}\right).$$

- ◆ When λ_2 -gap > 1.78 , $c_{time} < 2$, $c_{space} < 1$ by selecting $\xi = 1.0015$.

C_{time} s corresponding to different λ_2 -gap

α	ξ	r_0	C_{time} gap
1.78	1.0020	4.0409	1.9969
5	1.1768	8.3301	1.4246
8	1.2992	12.3483	1.2585
12	1.4308	17.7075	1.1502

Search SVP for Some Lattice-based Systems

 #RSAC

Search SVP for Some Lattice-based Systems

- ◆ LWE (Learning with Errors)-based cryptosystem

- ◆ A BDD instance in the q -ary lattice

$$\Lambda_q(\mathbf{A}^T) = \{\mathbf{y} \in \mathbb{Z}^m : \mathbf{y} = \mathbf{A}\mathbf{s} \bmod q \text{ for } \mathbf{s} \in \mathbb{Z}_q^n\}.$$

- ◆ [LW11] gave its λ_2 -gap of the embedding lattice.

- ◆ Our result: For the parameter $n = 128$ in the scheme[Gentry et. al.'08],

- ◆ λ_2 -gap ≈ 1288 .

- ◆ Time: $2^{0.8172m+o(m)}$.

- ◆ Space: $2^{0.4086m+o(m)}$.

- ◆ Approximately to $2^{0.802m+o(m)}$ ($2^{0.401m+o(m)}$).

Search SVP for Some Lattice-based Systems

- ◆ GGH encryption cryptosystem [Goldreich, Goldwasser, Halevi'97]
 - ◆ A BDD-based cryptosystem
 - ◆ five challenges: $n=200, 250, 300, 350, 400$.
 - ◆ [Nguyen'99] Four of them are solved and it is indicated the excepted $\lambda_2\text{-gap} > 9.4$.
 - ◆ Our result: The time complexity of ListSieve-Birthday is $2^{1.212n+o(n)}$.

Search SVP for Some Lattice-based Systems

- ◆ Worst-case/average-case equivalent cryptosystems

- ◆ uSVP_{n^c} based: [Ajtai, Dwork'97, Regev'04].

- ◆ GapSVP_{n^c} based: [Regev'09, Peikert'09].

Then can be equivalently based on $\text{uSVP}_{\tilde{O}(n^c)}$ since the reduction from uSVP_γ to GapSVP_γ .

- ◆ Our result: Time complexity is approximately to $2^{0.802n+o(n)}$.

Search SVP for some lattice-based systems

- ◆ NTRU encryption cryptosystem [Hoffstein, Pipher, Silverman'98]
 - ◆ Adopted to standard of IEEE Std 1363.1 in 2008.
 - ◆ [HPS98] Heuristically, the NTRU lattice (dimension= $2N$) has a λ_{N+1} -gap approximately $\sqrt{\frac{Nq}{4\pi e(d_f \cdot d_g)^{1/2}}} \lambda_1$.
 - ◆ For $N = 503, q = 256, d_f = 216, d_g = 72$, the time to solve this SVP of NTRU lattice is $2^{1.8054n+o(n)}$.

A Simple and Improved Algorithm for Integer Factorization with Implicit Hints

***Koji Nuida¹, Naoto Itakura², Kaoru Kurosawa²**

¹ AIST, Japan / JST PRESTO Researcher

² Ibaraki University, Japan

April 23, 2015

CHANGE

Challenge today's security thinking

Contents

- ◆ Introduction: Integer factoring with implicit hints for LSBs of factors
- ◆ Our results
 - ◆ Algorithm: Better bound, simpler proof
 - ◆ (Potential) application to “(batch) FHE over integers” etc.
- ◆ Details and computer experiments

RSA[®]Conference2015

San Francisco | April 20-24 | Moscone Center

Introduction

Background: Cryptography and Factoring

- ◆ Computational hardness of integer factoring is:
 - ◆ Necessary (and sometimes sufficient) for security of many cryptosystems
 - ◆ Including the RSA cryptosystem
 - ◆ Therefore, important to analyze

Background: Factoring with Hints

- ◆ Factoring with **explicit** hints
 - ◆ E.g., [Coppersmith 1996], where some bits of the factors are known
 - ◆ Related to: Side-channel attacks
- ◆ Factoring with **implicit** hints (**this work**)
 - ◆ E.g., [May-Ritzenhofen 2009], where only some **relations** of bits of the factors are known
 - ◆ Related to: Attacks on implementation with weak randomness

Factoring with Implicit Hints

- ◆ Simplest case ([MR09], [Kurosawa-Ueda 2013]):
For two integers $N_1 = p_1q_1, N_2 = p_2q_2$, assume

$$(t \text{ LSBs of } p_1) = (t \text{ LSBs of } p_2)$$

- ◆ Or equivalently, $p_1 \equiv p_2 \pmod{2^t}$
- ◆ Generalizations (*not considered in this work*):
 - ◆ More integers ([MR09], [Sarkar-Maitra 2011], ...)
 - ◆ MSBs, or combination of LSBs and MSBs ([SM11], ...)

Previous Results

- ◆ Assume $N_1 = p_1q_1, N_2 = p_2q_2$ and $p_1 \equiv p_2 \pmod{2^t}$
- ◆ Also assume $q_1, q_2 < 2^\alpha$ (i.e., q_1, q_2 are α -bit primes)
- ◆ Polynomial-time factoring of N_1, N_2 , if
 - ◆ [MR09] $t \geq 2\alpha + 3$
 - ◆ [KU13] $t \geq 2\alpha + 1$

RSA[®]Conference2015

San Francisco | April 20-24 | Moscone Center

Our Result: Summary

 #RSAC

Our Result

- ◆ Assume $N_1 = p_1q_1, N_2 = p_2q_2$ and $p_1 \equiv p_2 \pmod{2^t}$
- ◆ Also assume $q_1, q_2 < 2^\alpha$ (i.e., q_1, q_2 are α -bit primes)
- ◆ Polynomial-time factoring of N_1, N_2 , if
 - ◆ [MR09] $t \geq 2\alpha + 3$
 - ◆ [KU13] $t \geq 2\alpha + 1$
 - ◆ **Our result**: $t = 2\alpha - O(\log \kappa)$, where κ is a parameter (e.g., security parameter of a factoring-based cryptosystem)

**Non-constant
improvement!**

Advantage: Simplicity and Generality

- ◆ Our result (as well as [KU13]) extends to $p_1 \equiv p_2 \pmod{T}$ and $q_1, q_2 \leq Q$ for integers T, Q
 - ◆ Originally $T = 2^t, Q = 2^\alpha$
- ◆ We do NOT assume that p_1, p_2, q_1, q_2 are primes
 - ◆ Only assume that N_1, N_2, T are mutually coprime (almost automatic)
- ◆ Very simple, easy-to-follow proof
 - ◆ No lattice inequalities (Minkowski bound, Hadamard's inequality, ...)

Related Work

- ◆ Factors p_1, p_2, q_1, q_2 in [SM11] (and some others)
 - ◆ Prime
 - ◆ Balanced (i.e., $|p_i|_2 \approx |q_i|_2$)
 - ◆ In fact, their result requires $|p_i|_2$ to be bounded above

- ◆ Factors p_1, p_2, q_1, q_2 in our result

- ◆ **Not necessarily prime**

Good

- ◆ **Unbalanced** (i.e., $|p_i|_2 \gg |q_i|_2$)

Sometimes good (next slide)

- ◆ $|p_i|_2$ is bounded below only by the condition $t = 2\alpha - O(\log \kappa)$

(Potential) Applications

- ◆ Variants of (batch) “fully homomorphic encryption over integers” with error-free approximate GCD assumptions [Cheon et al. 2013], [N.-Kurosawa, EUROCRYPT 2015]
 - ◆ Ciphertexts are integers modulo $N = qp_1p_2 \cdots p_k$, where $|q|_2 \gg |p_i|_2$
 - ◆ Apply our result to factors p_i and N/p_i (**unbalanced**, **non-prime**)
- ◆ Okamoto-Uchiyama cryptosystem, Takagi’s variant of RSA
 - ◆ $N = p^r q, r \geq 2$ (**unbalanced**, **non-prime**)

San Francisco | April 20-24 | Moscone Center

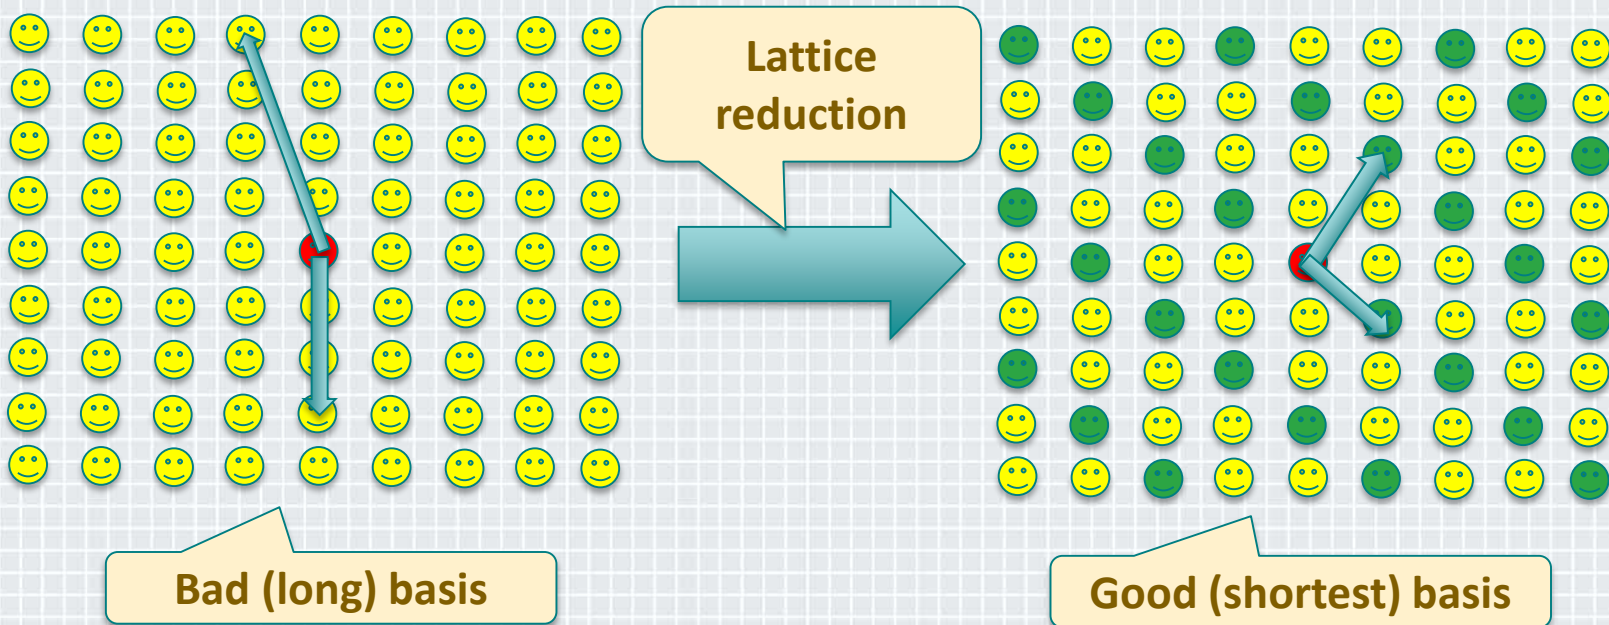

Our Result: Details

 #RSAC

(Integer) Lattice and Basis Reduction

◆ Lattice in 2-dim. plane

Lattice for Our Problem

◆ $L = \{(x_1, x_2) \in \mathbb{Z}^2 : N_2 x_1 - N_1 x_2 \equiv 0 \pmod{T}\}$

(recall $N_1 = p_1 q_1, N_2 = p_2 q_2, p_1 \equiv p_2 \pmod{T}$)

- ◆ Same as previous work
- ◆ L and initial basis $(1, N_2/N_1 \pmod{T}), (0, T)$ are publicly known
- ◆ Involves secret vector $\vec{q} = (q_1, q_2)$

Find this!

Previous Results

- ◆ Outline of [KU13]:
 - ◆ Find the shortest vector \vec{v} in 2-dim. lattice L by Gaussian reduction
 - ◆ If **(*) the second shortest basis vector of L is longer than \vec{q}** , then $\vec{q} \propto \vec{v}$, in particular $\vec{q} = (q_1, q_2) = \pm \vec{v}$ (since q_1, q_2 are coprime)
 - ◆ (*) is guaranteed when $t \geq 2\alpha + 1$ (by Hadamard's inequality)
 - ◆ And not guaranteed if $t < 2\alpha + 1$

Our Idea

- ◆ Use not only the shortest vector \vec{v} , but **also the second shortest basis vector \vec{u}** (both obtained by Gaussian reduction at once)
 - ◆ $\vec{q} = (q_1, q_2)$ can be written as $\vec{q} = a\vec{v} + b\vec{u}$, $a, b \in \mathbb{Z}$
 - ◆ If **(**)** $|a|, |b| \leq \mathit{poly}(\kappa)$, then a, b (hence \vec{q}) are found in time $\mathit{poly}(\kappa)$
 - ◆ $\vec{q} = a\vec{v} + b\vec{u}$ implies $|a|, |b| = \frac{|(\text{quadratic in } q_i, v_i, u_i)|}{|\det(\vec{v}, \vec{u})|} \leq (\text{const}) \cdot Q^2/T$
 - ◆ Where we used $|\det(\vec{v}, \vec{u})| = |\det((1, N_2/N_1 \bmod T), (0, T))| = T$ (property of Gaussian reduction) and $\|\vec{v}\| \leq \|\vec{u}\| \leq \|\vec{q}\| \leq Q$
 - ◆ The other case $\|\vec{q}\| < \|\vec{u}\|$ is as in the previous work
 - ◆ Hence **(**)** is guaranteed when $Q^2/T = \mathit{poly}(\kappa)$ (or $2\alpha - t = O(\log \kappa)$)

Our Proposed Algorithm

1. Compute \vec{v}, \vec{u} from $(1, N_2/N_1 \bmod T), (0, T)$ by Gaussian reduction
2. Output common factors of N_i and v_j (or u_j), if exists
3. For $A = 2, 3, \dots$, do the following
 1. For integers a, b satisfying $|a| + |b| = A$, do the following
 1. If $|av_1 + bu_1|$ is a non-trivial factor of N_1 , output it

Computer Experiments: Average Time

- $\alpha = 250$
- Range of t :
501 = $2\alpha + 1$ to 475
- Ordinary PC
- 100 trials each

100% Success

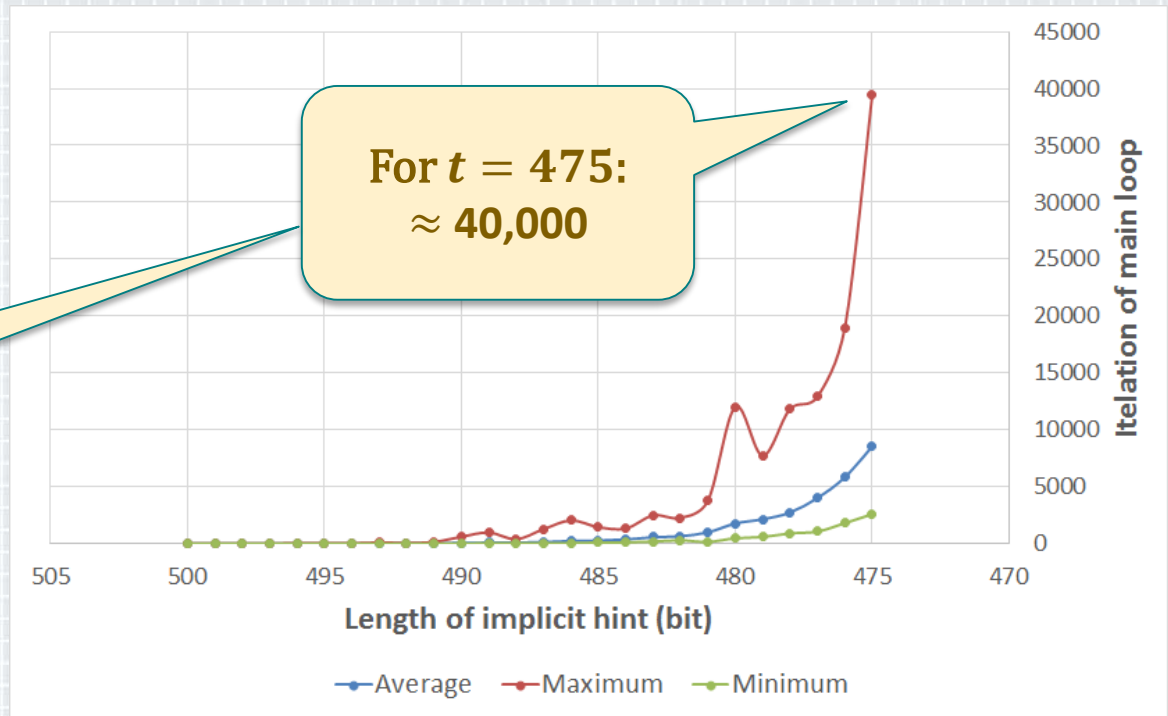

(cf., in [KU13]:
40% for $t = 500$
0% for $t = 499$)

Computer Experiments: # of Iterations

- $\alpha = 250$
- Range of t :
501 = $2\alpha + 1$ to 475
- Ordinary PC
- 100 trials each

Bound by our argument:
 $\leq 2^{2\alpha+2-t}$
 $= 2^{27} \approx 1.34 \times 10^8$
 (Probably too loose)

RSA[®]Conference2015

San Francisco | April 20-24 | Moscone Center

Summary

Summary and Future Work

- ◆ Improvement of a known factoring algorithm with implicit hints
 - ◆ Better bound, even by a simpler proof
- ◆ (Potential) applications; e.g., (batch) FHE over integers
- ◆ Future work:
 - ◆ Sharper analysis of bounds?
 - ◆ More applications?

**Thank you
for your attentions!**
