## CHANGE

Challenge today's security thinking

Intel Mica

Misfit shine

Apple watch

DESIGN

There's an Apple Watch for everyone.

Selecting a watch is very personal. As with all things you wear, how it looks is at least as important as what it does. So we set out

Google Glass

Fitbit flex

Android wear

Nod Ring

# The promise and the perils of wearables

## New opportunities

- ◆ Novel user interfaces
- ◆ Novel data collection uses
- ◆ More personal
- ◆ More available

## Big challenges

- ◆ Power efficiency
- ◆ Diverse HW/SW
- ◆ Security

# Overview of the talk

## New opportunities

- ◆ BRACE: Bilateral recurring authentication conducted effortlessly

*An example of a novel use of wearables in security applications*

## Big challenges

- ◆ Amulet: Secure computational jewelry for wearable mHealth applications

*An architecture that addresses the challenges of implementing a secure low-power wearable device*

# RSA<sup>®</sup>Conference2015

San Francisco | April 20-24 | Moscone Center

## BRACE

**Shrirang Mare**, *Dartmouth*

**Andrés Molina-Markham**, *RSA Labs*

**Cory Cornelius**, *Intel Labs*

**Ronald Peterson**, *Dartmouth*

**David Kotz**, *Dartmouth*

 #RSAC

# Motivation: Clinical workstations

- ◆ Unattended logged-in computers
- ◆ Security risk
- ◆ Compliance issues

Shutterstock photos under license

# The De-authentication Problem

- ◆ Users forget to logout
- ◆ They intentionally do not logout

<http://millerhealthlaw.com/company>

# Existing solutions

- ◆ Timeouts are too long, or too quick
- ◆ Human proximity detector
  - ◆ Styrofoam cup story

# Our solution

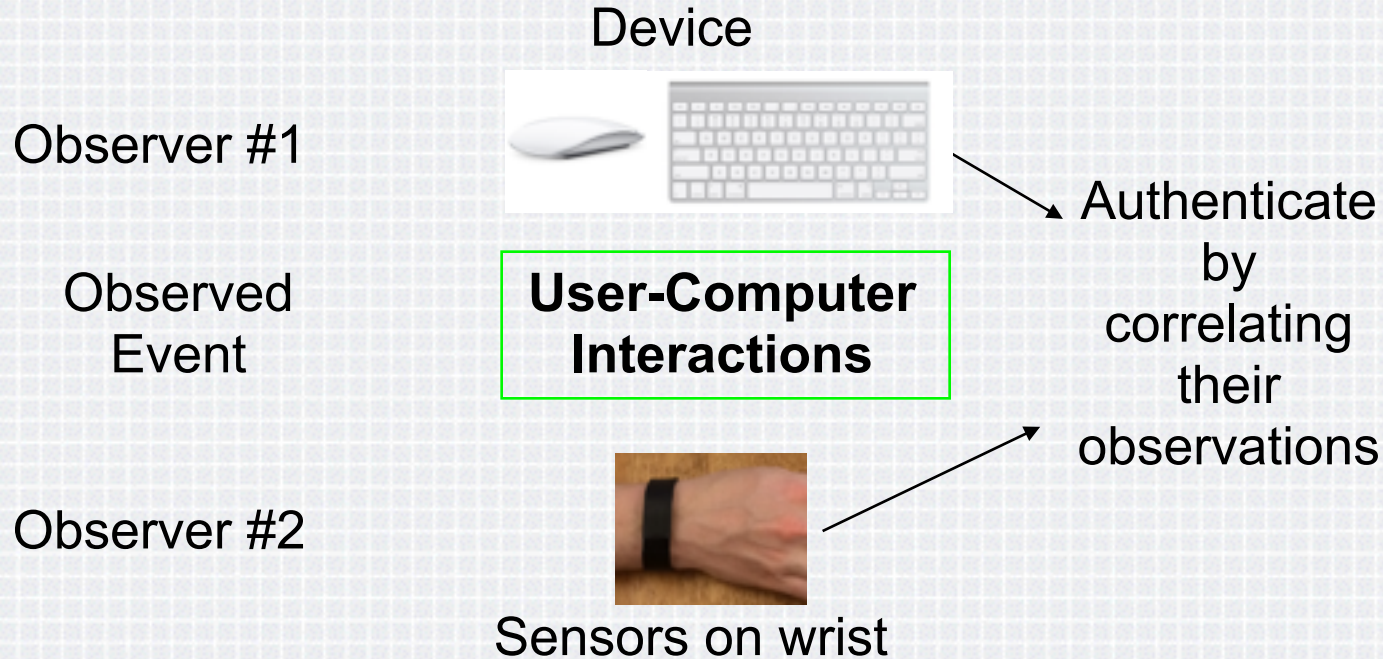

## What interactions a user performs

- ◆ Monitor wrist movement with wristband
- ◆ Correlate wrist movement and input to computer

# Bilateral authentication

# Mouse-Keyboard Switch (MKKM)

Wrist movement during computer interaction

### Interactions

- 1. Typing
- 2. Scrolling
- 3. Mouse-Keyboard switch

$F_0$

Classifier

$I'_0, t'_s, t'_e$

Sequence of Interactions

Correlate

Actual  
Sequence of Interactions

$I_0, t_s, t_e$

Estimated

# Evaluation

## User study

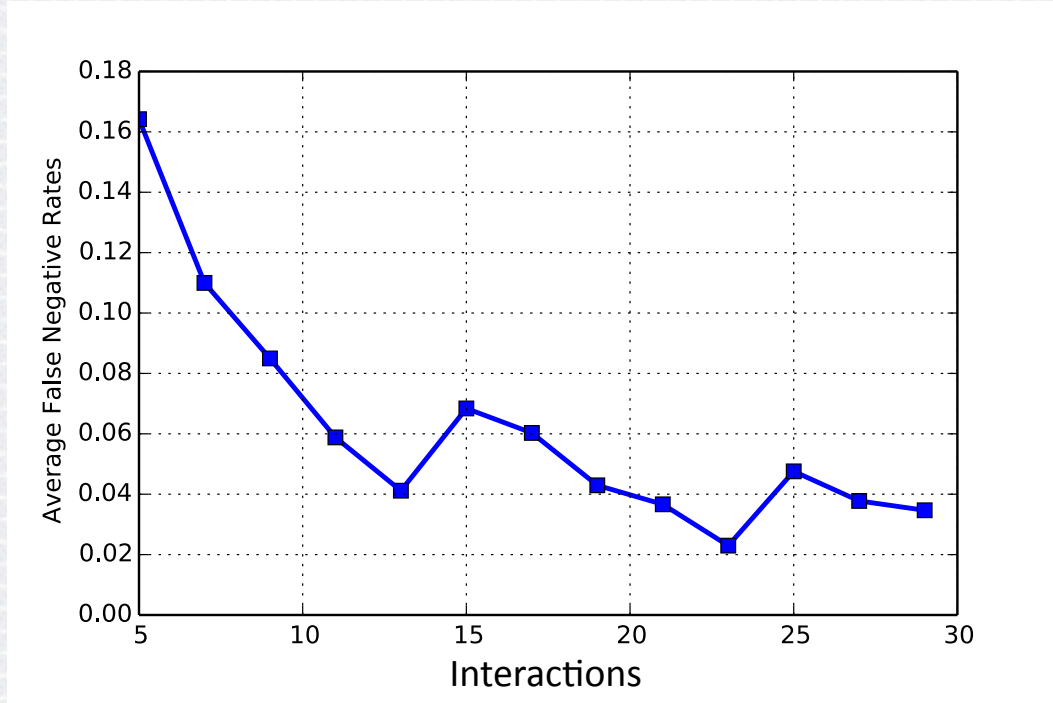

- ◆ 20 subjects
- ◆ 30-40 mins study session

## Tasks during study:

- ◆ Fill out web survey
- ◆ Browse internet
- ◆ Mimic another user

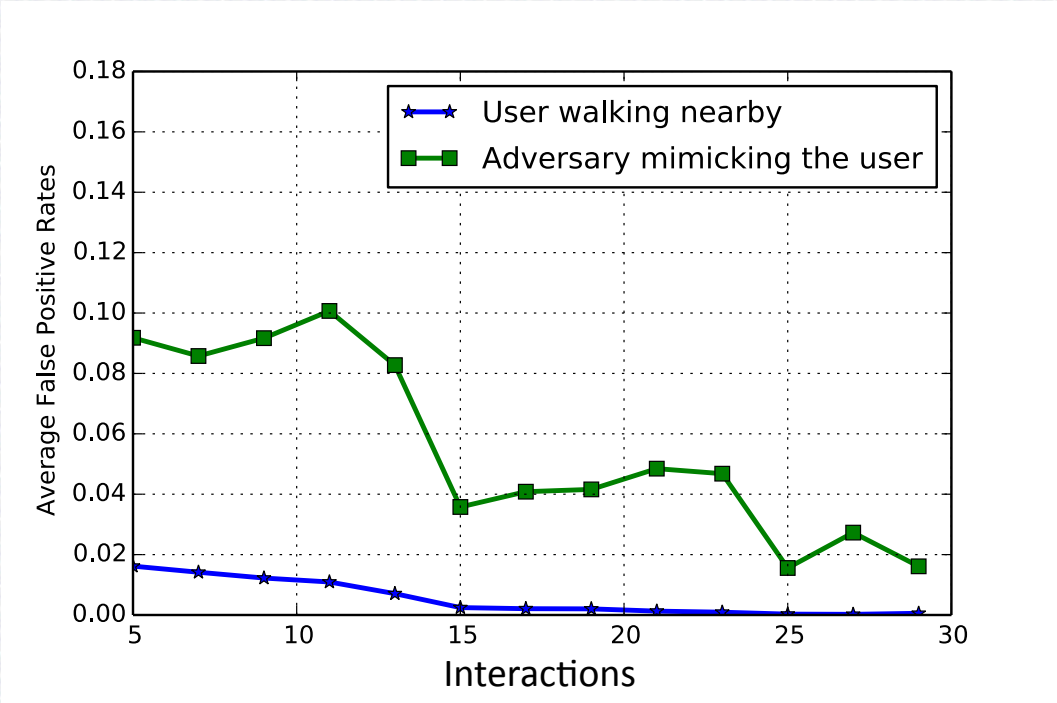

# Usability

Average False Negative Rate vs. Number of interactions

# Security

Average False Positive Rate vs. Number of interactions

# Security

Identified  
adversary  
in  
11 seconds

Fraction of **adversaries** that have access at time  $t$

# BRACE Summary

- ◆ Bilateral authentication approach
- ◆ BRACE for continuous authentication
- ◆ Evaluated feasibility with a user study
  - ◆ High-usability setting: 90% accuracy; 50 sec to identify adversary
  - ◆ Low-usability setting: 85% accuracy; 11 sec to identify adversary

# Problem:

Smartphones break

or get lost ...

image: [thetimes.co.uk](http://thetimes.co.uk)

image: [techgc.net](http://techgc.net)

or are simply  
left behind

# One alternative: Amulet for mHealth

A wearable device that provides a highly available runtime for mHealth applications

# Wearable platform requirements

- ◆ **Secure** application runtime
- ◆ **Independent** from the smartphone and more present
- ◆ **Small** enough to wear
- ◆ **Efficient** enough to last for a day or longer
- ◆ **Extensible** because it supports the easy addition of devices and applications
- ◆ **Open** for others to use and improve

# Amulet challenges

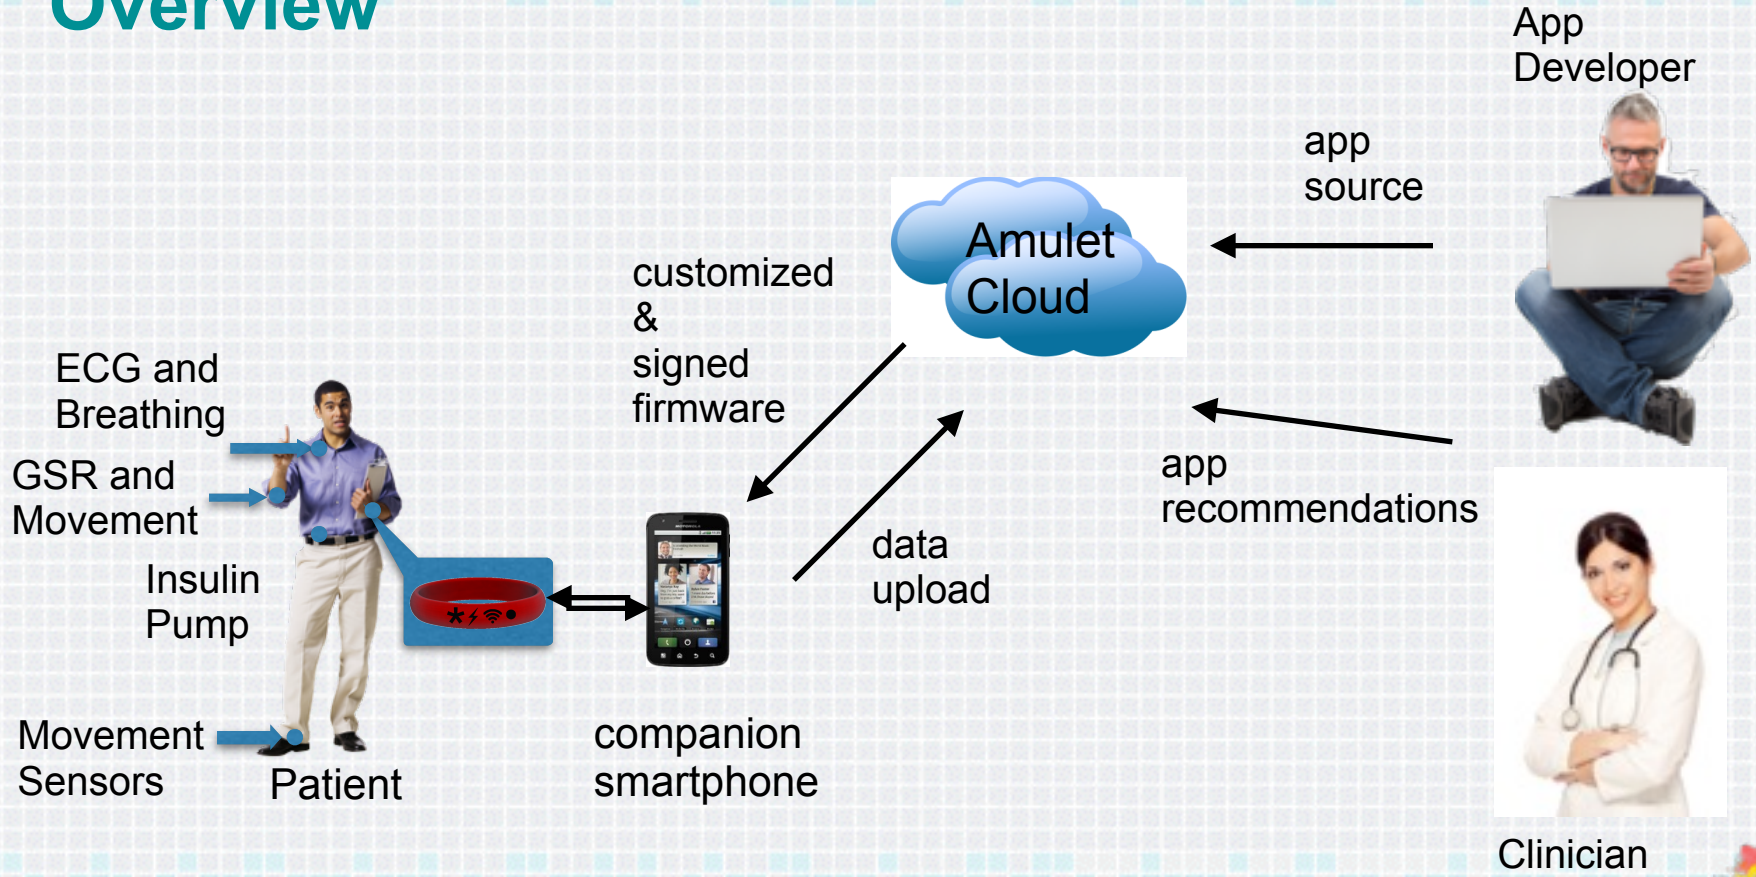

- ◆ **Security-focused architecture**
- ◆ **Power-efficient hardware & software**
- ◆ **Programming model for third-party apps**

[Netflix]

# Overview

# Security

- ◆ Apps **sandboxed** at compile-time
  - ◆ Safe subset of C sandboxes each app
  - ◆ Amulet installs only trusted firmware images
- ◆ Apps **limited to authorized resources**
  - ◆ Every app request is checked against policy
- ◆ App **actions logged** for later auditing
  - ◆ Secure audit trail in persistent memory

# Inside the amulet

- ◆ Two-board design
  - ◆ “Radio board” manages communications
  - ◆ “App board” runs apps and UI
- ◆ App board is off when idle
  - ◆ Radio board boots it only when needed
  - ◆ Must be quick to boot and reload apps
  - ◆ Apps must survive such reboots
- ◆ Apps: finite-state machines w/memory
  - ◆ Set of states, variables, and event handlers
  - ◆ All state is explicit, in non-volatile storage
  - ◆ No threads: handlers run to completion

# Feasibility applications

- ◆ Fall detector
  - ◆ Accelerometer
- ◆ Emergency Response
  - ◆ Buttons
- ◆ Drowsiness detector
  - ◆ External heart-rate monitor (Mio)
- ◆ Bite counter
  - ◆ IMU sensor
- ◆ Battery lifetime 3.5–4.3 days
  - ◆ Can improve with optimization

# Amulet summary

## An Amulet for mHealth networks

- ◆ **Highly available:** wearable, compact device
- ◆ **Efficient:** dual-board event-driven architecture
- ◆ **Customizable:** third-party apps written in C
- ◆ **Secure:** app isolation, managed resources, audit log, trusted firmware, encrypted communications

Take away “Apply”

 #RSAC

# Apply

1. Think of how wearables may open opportunities for you
  - ◆ Novel use cases in security?
  - ◆ Novel private user interfaces?
  - ◆ New data streams for security mechanisms?
2. Think about the new challenges to security
  - ◆ Wearables are not tiny smartphones
  - ◆ Integration with other devices and services

# Apply

1. Does your novel use case with a wearable need:
  - ◆ Data?
  - ◆ Control?
  - ◆ Or more complex applications running on wearables?
  
2. Will wearables in your application be single purpose?
  - ◆ Or will they have multiple purposes with software from multiple vendors? (e.g., running on Android Wear)
  - ◆ Will data be primarily streamed in “data silos” or will your application interact with data from other applications?
