CHANGE

Challenge today's security thinking

RSA[®]Conference2015

San Francisco | April 20-24 | Moscone Center

The Pentest Conundrum

 #RSAC

Pentesting Debate

Pentesting Debate

- ◆ Morphing to vulnerability scanning and onto tick-box compliance
- ◆ “Penetration testing” being pulled to extremes:
 - ◆ Hardcore bug-hunting and reversing
 - ◆ Semiconductor reversing
 - ◆ Red Team testing
- ◆ *“Testing as a pentester, rather than an attacker”*

Where is the threat?

- ◆ “Hackers” continue to probe defenses, scan ports, and enumerate services.
- ◆ External attacks against unpatched OS-vulnerabilities (in)frequent.
- ◆ Attacks that exploit unpatched vulnerabilities and manage to breach corporate defenses through the front door are an increasingly rare breed.

RSA[®]Conference2015

San Francisco | April 20-24 | Moscone Center

The Real Threat

Ignoring the Real Threat

Most breaches start and end with malware...

Breached

- ◆ Malware accounts for vast majority of breaches
 - ◆ Vehicle for getting inside the target
 - ◆ Platform for horizontal movement
 - ◆ Tool for data extraction and remote access
- ◆ Successful attacks delivered through:
 - ◆ Barrage of social engineering & trickery
 - ◆ Browser & user-level application subversion

Enterprise Penetration

- ◆ Penetration of an enterprise network requires the defeat and subversion of multiple layers of defense
 - ◆ Including anti-virus and intrusion prevention technologies.

Enterprise Penetration

Cloud

Email/attachment scanning, URL checking, etc.

Gateway

Proxy filtering, URL filtering, etc.

DMZ

Scanning appliances, Dynamic analysis, VM, etc.

Server

Mail server/archive scanning, host scanning, etc.

Endpoint

Desktop suites, etc.

Malware

Biggest Failure

- ◆ Unwarranted “faith” in (dynamic) malware analysis tools
 - ◆ Appeals like diet pills
 - ◆ Promise of weight loss without altering lifestyle
- ◆ No changes to business practices
 - ◆ Malware gets smarter
 - ◆ Vectors gets smarter
 - ◆ Network just as dirty as ever

Pentesting Requirements

- ◆ In order to test these defenses...
 - ◆ It is necessary to construct the same kind of advanced and stealthy malware as employed by the (best) cybercriminals
 - ◆ We need to deploy the malware in a similar fashion to the cybercriminals

The “Ethics” Question

- ◆ Beg, borrow, or steal tools from the bad-guys?
- ◆ Engage the underground ecosystem and pay their fees?
- ◆ Access or construct better tools than what the “average” bad-guys have?
- ◆ Pollution of commercial AV with non-criminal malware?
- ◆ Blah, blah, blah...

Pentesting Twenty-teenies

- ◆ Need new penetration testing methodologies designed to replicate current generation attack profiles and stress the layered defense model.
- ◆ Practical considerations
 - ◆ Which layer(s) detected it?
 - ◆ Did it compromise the target host?
 - ◆ Is the malware serviceable to an attacker?

RSA®Conference2015

San Francisco | April 20-24 | Moscone Center

Building Malware

Malware Construction

- ◆ Plenty of samples, but need something new...

Modification of existing source code

Tweaking of existing malware

“Lawful intercept” malware

Underground cybercrime kits

Commercial malware kits

- ◆ Growing business need (*start a business!*)

- ◆ **Not** worth throwing yesterday’s malware at a target...

Malware Armoring

- ◆ “Off-the-shelf” malware trivial to detect
- ◆ Armoring tools & methodologies advancing at a rapid pace
 - 👉 Anti-debugging
 - 👉 Anti-virtualization
 - 👉 Anti-decompilation
 - 👉 Polymorphic manipulators, etc.
- ◆ Most tools are “commercial”, efficient, and *not* backdoored (surprisingly)

Malware Vetting

- ◆ Create one or many samples?
 - ◆ **Many!!!**
 - ◆ Create a “tree” of malware derivatives
 - ◆ Naked, armored, hardened, to “the works”
- ◆ Should I pre-test the malware?
 - ◆ **Yes**, but only if you can keep the samples to yourself
 - ◆ Turn off “cloud” submissions and analytics
- ◆ Can I reuse my old samples?
 - ◆ **No.**

For Corporate Use Only

- ◆ Include a marker within your malware specific to the job
 - ◆ Files identified through binary inspection
 - ◆ Don't make it obvious though
- ◆ Choose carefully the method of C&C
 - ◆ Protocols are important, so too is being proxy-aware
 - ◆ Static and dynamic routes to C&C
- ◆ Report/record which host affected
 - ◆ Beaconing after XXX hours is good

Vectors Are Important

- ◆ But don't get hung up on them
 - ◆ Remember the scope of the pentest
 - ◆ Red Team offers more opportunities
- ◆ Assessing the security of layered-defenses
 - ◆ Multiple samples, multiple vectors
 - ◆ Preparation is key
 - ◆ Expect to expend 4 days effort building , tuning, and watermarking samples
 - ◆ Takes 3+ days to research/build spear-phishing lists and messages

Attack Vectors

- ◆ Social engineering vectors tend to be more successful
 - ◆ Email with URL's to download malware
 - ◆ Dropping Trojanized files on file servers
 - ◆ Career/recruitment portals accepting attachments
- ◆ Deploying malware through exploited vulnerabilities
 - ◆ Horizontal propagation done via malware

Client Considerations

1. Make sure T&C's cover malware behaviors
2. Be specific on engagement scope and what vectors are allowable
3. Document and tag each sample that is to be deployed
4. Post-engagement C&C locations, beaconing, and tag information must be disclosed
5. Submit all samples to AV vendors afterwards

Conclusions

- ◆ Penetration testing methods need to include “malware”
- ◆ Difference between testing the layers of detection versus layers of prevention
- ◆ There are many good/safe tools
- ◆ Preparation effort and duration for testing are not insignificant
- ◆ CYA on T&C’s and post-op cleanup

Apply... actions...

- ◆ Immediate actions
 - ◆ Document your anti-malware defensive layers
 - ◆ Assume you will always be breached by malware – focus upon immediate detection & automated remediation
- ◆ Next 3 months
 - ◆ Plan on assessing malware defenses on a quarterly basis
 - ◆ Ensure that network anomaly detection tools are capable of detecting malware communication artifacts
 - ◆ Identify layers of implicit trust and double-down on defenses
