

Learning Object-Oriented Programming and Design with TDD

Booleans and Conditions

Stéphane Ducasse

<http://stephane.ducasse.free.fr>

Booleans

true and false are two objects!

Boolean Messages

In Pharo, booleans have nothing special

- & | not
- or: and: (lazy)
- xor:
- ifTrue:ifFalse:
- ifFalse:ifTrue:
- ifFalse:
- ifTrue:

The not message: quite obvious :)

```
true not  
>>> false
```

```
false not  
>>> true
```

Eager and Lazy Logical Operators

```
false & (1 error: 'crazy')  
-> an error
```

- the argument (1 error: 'crazy') is executed because this is a non lazy operator

```
false and: [ 1 error: 'crazy' ]  
-> false "no error!"
```

- the argument [1 error: 'crazy'] is not executed because it is not necessary

Conditionals are Messages too

In Pharo, traditional conditional (if, else, while) are messages sent to boolean or block objects

Yes ifTrue:ifFalse: is a message!

Weather isRaining

```
ifTrue: [ self takeMyUmbrella ]  
ifFalse: [ self takeMySunglasses ]
```

- Conceptually ifTrue:ifFalse: is a message sent to an object: a boolean!
- Heavily optimised by the compiler

Conditionals: ifTrue: and ifTrue:ifFalse:

ifTrue: [] and ifTrue: [] ifFalse: [] are two different messages

forceItalicOrOblique

self slantValue = 0

ifTrue: [slantValue := 1]

fullName isEmptyOrNil

ifTrue: ['FirstnameLastname' translated]

ifFalse: [fullName].

Conditionals: ifFalse: and ifFalse:ifTrue:

ifFalse: [] **and** ifFalse: [] ifTrue: [] are two different messages

Conditionals: ifEmpty: ifNotEmpty:

```
myProtocol  
ifEmpty: [ 'As yet unclassified' ]
```

```
self listItems  
ifNotEmpty: [ :aList | aList at: index ]
```

- Notice that when the receiver is not empty we get it as argument
- No need to ask it again

Summary

- Booleans are real objects
- Some conditionals are messages sent to Booleans
