**Learning Object-Oriented
Programming and Design with TDD**
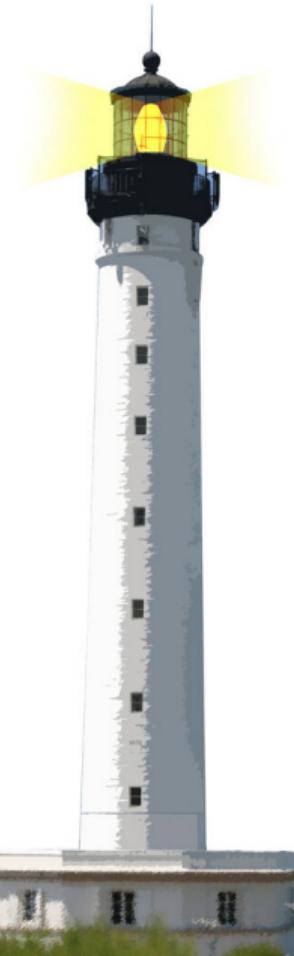

Basics on Variables

Stéphane Ducasse

http://stephane.ducasse.free.fr

In a Nutshell

- **Local** variables start with **lowercase** (temps, instance variables, arguments,...)
- **Shared** variables start with **uppercase** (class, class variables)

Local Variables Start with Lowercase

Temporary variables are local to the method

Example: c

```
CounterTest >> testIncrement
  | c |
  c := Counter new.
  ...
```

Remember: class names start with uppercase

Local Variables Start with Lowercase

Instance variables are local to the object

Example: x, y, count

```
Object subclass: #Point
  instanceVarNames: 'x y'
```

```
Object subclass: #Counter
  instanceVarNames: 'count'
```

Local Variables Start with Lowercase

Method arguments: aPoint

crossProduct: aPoint
  "Answer a number that is the cross product of the receiver and the argument, aPoint."

  ^ (x * aPoint y) − (y * aPoint x)

Block arguments: :x

[:x | x + 2]

Special Variables

Special variables cannot be changed

- true, false, nil
- self, super, thisContext

Special Variables

- true, false are the Booleans
  - true is the unique instance of the class True
  - false is the unique instance of the class False
- nil is the unique instance of the class UndefinedObject

Special Variables

- self refers to the receiver of the message (this in Java)
- super refers to the receiver of the message (see dedicated Lectures)
- thisContext refers to the current execution stack (advanced)

Shared or Global Variables start with Uppercase

Object is a class globally accessible

```
Object subclass: #Point
```

Transcript is an object that is globally accessible (a kind of stdout)

```
Transcript cr.
Transcript show: 'hello world'.
Transcript cr.
```

Summary

- Lowercase are used for local/private/temporary variables
- Uppercase are used for shared or global variables
