# Quick List of Examples

Use this list to help you locate examples you'd like to try or look at.

Example 1-1	Iteratively determining command syntax using command-line help	4
Example 1-2	Committing Changes	7
Example 1-3	"configure": Entering configuration mode	8
Example 1-4	Deleting configuration	9
Example 1-5	Navigating with the "edit" command	12
Example 1-6	The "help" command	14
Example 1-7	Loading configuration from a file	17
Example 1-8	"run": Using an operational command within configuration mode	19
Example 1-9	Saving configuration to a file	21
Example 1-10	"save": Saving configuration to a file on a TFTP server	22
Example 1-11	"set": Adding an Ethernet interface	24
Example 1-12	Show commands available in operational mode	26
Example 1-13	Show command in configuration mode	26
Example 1-14	Error in showing unconfigured functions	27
Example 1-15	Exiting a "More" screen	28
Example 1-16	Exiting a "More" screen	28
Example 1-17	"top": Navigating to the top of the configuration tree	29
Example 1-18	"up": Navigating up through the configuration tree	30
Example 2-1	"init-floppy": Preparing a floppy diskette for a configuration file	36
Example 2-2	"reboot": Rebooting the router	38
Example 2-3	"show arp": Displaying the ARP cache	41
Example 2-4	"show configuration": Displaying the configuration tree in operational mode	42
Example 2-5	"show files": Listing files in the file system	43
Example 2-6	"show hardware cpu": Showing CPU information	44
Example 2-7	"show hardware mem": Showing hardware memory information	46

Example 2-8 “show host”: Finding information about network hosts .....	49
Example 2-9 “show host name”: Finding the names of network hosts .....	49
Example 2-10 “show host name”: Showing the system date and time .....	49
Example 2-11 “show host os”: Showing operating system information .....	49
Example 2-12 “show interfaces”: Displaying interface information .....	51
Example 2-13 “show ntp associations”: Showing configured NTP servers .....	53
Example 2-14 “show system boot-messages”: Displaying startup messages .....	54
Example 2-15 “show system connections”: Displaying active connections .....	56
Example 2-16 “show system kernel-messages”: Displaying messages from the kernel .....	58
Example 2-17 “show system memory”: Displaying information about memory usage .....	60
Example 2-18 “show system processes”: Displaying process information .....	61
Example 2-19 “show system storage”: Displaying file system and storage information .....	63
Example 2-20 “show tech-support” Displaying consolidated system information .....	64
Example 2-21 “show version”: Displaying router software information .....	66
Example 3-1 “show interfaces ethernet”: Displaying Ethernet interface information .....	103
Example 3-2 “show interfaces ethernet ethX physical”: Displaying physical line characteristics for Ethernet interfaces 103	
Example 4-1 “show interfaces serial”: Displaying serial interface information .....	126
Example 4-2 “show interfaces serial wanx ppp” .....	126
Example 6-1 Populating the MRIB using the FIB2MRIB module .....	150
Example 6-2 “show route”: Displaying routes .....	156
Example 6-3 “show route”: Displaying static routes .....	157
Example 6-4 “show route”: Displaying routes of a specified prefix length .....	157
Example 6-5 “show route”: Displaying routes with a specified next hop .....	157
Example 6-6 “show route”: Piping output through a UNIX command .....	158
Example 10-1 “show bgp peers”: Displaying a list of BGP peers .....	220
Example 14-1 “clear vrrp”: Clearing VRRP statistics from an interface. ....	299
Example 17-1 “show vpn debug” sample output .....	350
Example 17-2 “show vpn debug detail” sample output .....	351
Example 17-3 “show vpn ike sa” sample output .....	353
Example 17-4 “show vpn ike status” sample output .....	354
Example 17-5 “show vpn ipsec sa” sample output .....	356
Example 17-6 “show vpn ipsec sa statistics” sample output .....	357
Example 17-7 “show vpn ipsec status” sample output .....	359
Example 20-1 “show snmp statistics”: Viewing SNMP statistics .....	398
Example 21-1 Sample output of “ping” .....	402

---

Example 21-2 Sample output of “ping6” ..... 404

# Preface

This guide explains how to use the Vyatta OFR router, and how to use Vyatta OFR router commands in the command-line interface. It provides an overview of the router's functionality, highlighting core concepts, and a detailed description of each available command.

This preface provides information about using this guide. The following topics are covered:

- Intended Audience
- Organization of This Guide
- Document Conventions
- Vyatta Publications

---

## Intended Audience

---

This guide is intended for experienced system and network administrators. Depending on the functionality to be used, readers should have specific knowledge in the following areas:

- Networking and data communications
- TCP/IP protocols
- General router configuration
- Routing protocols
- Network administration
- Network security

---

## Organization of This Guide

---

This guide has the following aids to help you find the information you are looking for:

- **Quick List of Examples**

Use this list to help you locate examples you'd like to try or look at.

- **Quick Guide to Configuration Statements**

Use this section to quickly see the complete syntax of configuration statements.

This guide has the following chapters and appendixes:

Chapter	Description	Page
Chapter 1: Using the CLI	This chapter describes commands for using the CLI.	1
Chapter 2: System Management	This chapter describes commands required for basic system management tasks.	31
Chapter 3: Ethernet Interfaces, VLANs, and Bridging	This chapter lists the commands for configuring Ethernet interfaces, virtual interfaces (with optional VLAN tagging), the loopback interface, IP addresses, and bridging.	77
Chapter 4: Serial Interfaces	This chapter lists the commands for configuring serial interfaces.	105
Chapter 5: Basic Services	This chapter describes commands required to deploy basic protocol services such as DHCP, HTTP, SSH, and Telnet.	128

Chapter 6: Forwarding and Routing	This chapter lists commands for enabling and disabling forwarding, and for displaying general routing information.	143
Chapter 7: Static Routes	This chapter lists the commands for configuring static routes on the Vyatta OFR.	159
Chapter 8: RIP	This chapter lists the commands for setting up the Routing Information Protocol (RIP) on the Vyatta OFR.	164
Chapter 9: OSPF	This chapter lists the commands for configuring OSPF on the router.	183
Chapter 10: BGP	This chapter lists the commands for setting up the Border Gateway Protocol on the Vyatta OFR.	199
Chapter 11: IGMP and MLD	This chapter lists the commands for setting up Internet Group Management Protocol and Multicast Listener Discovery protocol on the Vyatta OFR.	223
Chapter 12: PIM Sparse-Mode	This chapter lists the commands for setting up Protocol Independent Multicast on the Vyatta OFR.	237
Chapter 13: Routing Policies	This chapter lists the commands you can use to create routing policies.	276
Chapter 14: VRRP	This chapter lists the commands for setting up the Virtual Router Redundancy Protocol on the Vyatta OFR.	297
Chapter 15: NAT	This chapter lists the commands for setting up NAT on the Vyatta OFR.	309
Chapter 16: Firewall	This chapter lists the commands for setting up firewall functionality on the Vyatta OFR.	321
Chapter 17: IPsec VPN	This chapter lists the commands for setting up IPsec VPN on the Vyatta OFR.	348
Chapter 18: User Authentication	This chapter lists the commands available for setting up user accounts and user authentication.	372
Chapter 19: Logging	This chapter lists the commands used for system logging.	378
Chapter 20: SNMP	This chapter lists the commands for setting up the Simple Network Management Protocol on the Vyatta OFR.	389

Chapter 21: Diagnostics and Debugging	This chapter lists supported commands that can be used for diagnostics and debugging.	399
Chapter 22: Software Upgrades	This chapter lists commands for using the Vyatta OFR's software upgrade mechanism.	407
Appendix A: ICMP Types	This appendix lists the ICMP types defined by the Internet Assigned Numbers Authority (IANA).	418
Appendix B: Regular Expressions	This appendix describes the regular expressions that can be recognized by the Vyatta OFR.	418
Quick Guide to Configuration Statements	Use this section to quickly see the complete syntax of configuration statements.	425
Glossary		446

## Document Conventions

This guide contains advisory paragraphs and uses typographic conventions.

### Advisory Paragraphs

This guide may use the following advisory paragraphs:

**Warnings** alert you to situations that may pose a threat to personal safety, as in the following example:

**WARNING** *Risk of injury. Switch off power at the main breaker before attempting to connect the remote cable to the service power at the utility box.*

**Cautions** alert you to situations that might cause harm to your system or damage to equipment, or that may affect service, as in the following example:

**CAUTION** *Risk of loss of service. Restarting a running router will interrupt service.*

**Notes** provide information you might need to avoid problems or configuration errors:

**NOTE** *You must create and configure network interfaces before enabling them for routing protocols.*

**Tip:** *Use tips to save time and effort.*

**Tips** (see left) provide helpful information for doing something in a faster or easier way, or for optimizing the performance of your system.

## Typographic Conventions

In addition to advisory paragraphs, this document may use the following typographic conventions:

<code>Courier</code>	Courier font is used in command syntax sections and in special example paragraphs.
<b><code>boldface Courier</code></b>	Boldface Courier font is used to show something you enter at a command line.
<b><code>boldface</code></b>	Boldface font is used to represent commands or keywords inside a paragraph of ordinary text.
<i>italics</i>	Italic font is used to show arguments and variables, where you supply the value.
<code>&lt;key&gt;</code>	Angle brackets are used to indicate a key on your keyboard. Combinations of keys are joined by plus signs (“+”).  An example is <code>&lt;Ctrl&gt;+&lt;Alt&gt;+&lt;Del&gt;</code> .
<code>[ arg1 arg2 ]</code>	Square brackets enclose enumerated options for completing a syntax. The options are separated by a vertical bar.  An example is <code>[enable disable]</code> .
<code>num1–numN</code>	The typographic convention at left indicates a range of numbers.  An example is 1–65535, which means 1 through 65535 inclusive.
<code>arg1..argN</code>	The typographic convention at left indicates a range of enumerated values. An example is <b>eth0..eth23</b> , which means <b>eth1</b> , <b>eth2</b> , <b>eth3</b> , and so on through <b>eth23</b> .
<code>arg [arg ...]</code>	The typographic convention at left indicates a value that can optionally represent a space-separated list of the same kind of element (for example, a space-separated list of IP addresses).

---

# Vyatta Publications

---

The Vyatta technical library includes the following publications:

Vyatta OFR Quick Start Guide	Explains how to install the router software, and provides some basic configuration to get you started.
Vyatta OFR Configuration Guide	Explains router functions, and steps through sample configurations for every function.
Vyatta OFR Command Reference	Provides a complete description of each command in the CLI.

# Chapter 1: Using the CLI

This chapter describes commands for using the CLI.

This chapter contains the following commands.

Command	Mode	Description
? (help)	Configuration Operational	Shows available options for completing a command.
commit	Configuration	Applies any uncommitted configuration changes.
configure	Operational	Switches to configuration mode.
delete	Configuration	Deletes a configuration node.
edit	Configuration	Navigates to the specified configuration node for editing.
exit	Configuration Operational	Exits from this level of use to the level above.
help	Configuration Operational	Displays information describing what a command does and how to use it.
load	Configuration	Loads configuration information from the specified file, discarding the current configuration.
quit	Configuration Operational	Exits from this level of use to the level above.
run	Configuration	Runs the specified operational command without leaving configuration mode.
save	Configuration	Saves the current configuration to the specified file.
set	Configuration	Creates a new configuration node, or changes a value in an existing configuration node.
show	Configuration	Displays configuration information (configuration mode) or system information (operational mode).
top	Configuration	Exits to the top level of configuration mode.
up	Configuration	Navigates up one level in the configuration tree.

*See also* the following commands in other chapters.

<code>init-floppy</code>	Operational	Formats a floppy diskette and prepares it to receive a configuration file. <i>See page 36.</i>
<code>rtrmgr</code>	Operational	Allows you to change the default location for configuration files. <i>See page 39.</i>
<code>init-floppy</code>	Operational	Formats a floppy diskette and prepares it to receive a configuration file. <i>See page 36.</i>

## ? (help)

Shows available options for completing a command.

---

### Command Mode

Configuration mode.

Operational mode.

---

### Syntax

<code>?</code>	<i>/* Lists available commands.</i>
<code>command ?</code>	<i>/* Lists options and parameters for the specified command.</i>

---

### Parameters

---

<i>command</i>	A command available in the current location.
----------------	--

---

---

### Usage Guidelines

Use this command to list the commands currently available to you, or to see what parameters are available for a command.

Typing a question mark (“?”) at the command prompt lists the commands currently available to you. The commands available will depend on what configuration you have added to the router.

Typing the question mark after a completed command lists the possible parameters for the command.

---

### Examples

Example 1-1 iteratively applies the question mark to obtain the complete syntax for the **show route system forward** command.

Example 1-1 Iteratively determining command syntax using command-line help

---

```
vyatta@R1> show route ?
Possible completions:
  <[Enter]>          Execute this command
  <prefix>           Show routing table information
  exact              Show routes exactly matching specified prefix
  next-hop           Show active prefixes with the specified
                     next hop
```

```
prefix-length      Show active prefixes with the specified
                   prefix length
protocol           Show routes learned through specified
                   protocol
system             Show system routing table information
|                 Pipe through a command
vyatta@R1> show route system ?
Possible completions:
  <[Enter]>        Execute this command
  forward          Show system forwarding table
  |               Pipe through a command
vyatta@R1> show route system forward ?
Possible completions:
  <[Enter]>        Execute this command
  |               Pipe through a command
vyatta@R1> show route system forward
```

---

# commit

Applies any uncommitted configuration changes.

---

## Command Mode

Configuration mode.

---

## Configuration Statement

`commit`

---

## Parameters

None.

---

## Usage Guidelines

Use this command to apply changes to configuration.

When you add configuration to the router, modify existing configuration, or delete configuration from the router, the changes you make must be committed before they take effect. To do this, you issue the **commit** statement.

If you try to exit or quit from configuration mode while there are still uncommitted configuration changes, the system will give you a warning. You will not be able to exit from configuration mode until you either commit the changes by issuing the **commit** statement, or you discard the changes using the **exit discard** statement (see page 13).

Until a configuration change is committed, the system marks the change when displaying the information.

Committing information can take time, depending on the complexity of the configuration and how busy the router is. Be prepared to wait for several seconds for the system to complete committing the information. The system will inform you when it has finished committing the information by issuing an “OK” response in the command line.

If two or more users are logged on to the router in configuration mode and one user changes the configuration, the other user(s) will receive a warning.

---

## Examples

The following example commits configuration changes.

### Example 1-2 Committing Changes

---

```
[edit interfaces ethernet eth0]
vyatta@vyatta# commit
OK
[edit interfaces ethernet eth0]
vyatta@vyatta# show
    address 172.16.0.65 {
        prefix-length: 24
    }
    address 172.16.0.63 {
        prefix-length: 24
    }

[edit interfaces ethernet eth0]
vyatta@vyatta#
```

---

# configure

Switches to configuration mode.

---

## Command Mode

Operational mode.

---

## Syntax

configure

---

## Parameters

None.

---

## Usage Guidelines

Use this command to switch to configuration mode, where you can modify aspects of router configuration.

When you are in configuration mode, the prompt pointer “>” changes to the pound sign “#” to indicate that you are in configuration mode (see Example 1-3).

---

## Examples

Example 1-3 shows the system’s response to the configure command. In this example, notice how the command prompt changes when the user enters configuration mode.

Example 1-3 “configure”: Entering configuration mode

---

```
vyatta@vyatta> configure
Entering configuration mode.
There are no other users in configuration mode.
[edit]
vyatta@vyatta#
```

---

# delete

Deletes a configuration node.

---

## Command Mode

Configuration mode.

---

## Configuration Statement

`delete path-to-config-node`

---

## Parameters

---

<i>path-to-config-node</i>	The path to the part of the configuration to be deleted.
----------------------------	--

---

---

## Usage Guidelines

Use this command to delete a part of configuration.

To do this, you delete the appropriate subtree from a configuration node. The deletion will be visible in the response to the **show** command. However, the information is not actually deleted until the change is committed using the **commit** command (see page 6).

---

## Examples

Example 1-4 deletes the **authentication** node from OSPF configuration.

Example 1-4 Deleting configuration

---

```
vyatta@R1# show protocols ospf4
router-id: 10.1.0.54
area 0.0.0.0 {
  interface eth0 {
    address 10.1.0.54 {
      authentication {
        md5 1 {
          password: "testmd5"
        }
      }
    }
  }
}
```

```
[edit]
vyatta@R1# delete protocols ospf4 area 0.0.0.0 interface eth0
address 10.1.0.54 authentication
Deleting:
    authentication {
        md5 1 {
            password: "testmd5"
        }
    }

OK
[edit]
vyatta@R1# commit
[edit]
OK
vyatta@R1#
```

---

# edit

Navigates to the specified configuration node for editing.

---

## Command Mode

Configuration mode.

---

## Configuration Statement

`edit path`

---

## Parameters

---

<i>path</i>	The path to the node of configuration tree you want to edit.
-------------	--

---

---

## Usage Guidelines

Use this command to navigate to a specific configuration subtree for editing. Once at that location, you can create a new configuration node, change configuration settings, or delete a configuration node.

- You can only edit a configuration node that has already been created. Configuration nodes are created and modified using the **set** command (see page 23).
- The changes you make do not take effect until they are committed using the **commit** command (see page 6).
- To delete a configuration node, use the **delete** command (see page 9).

After navigating to a branch of the configuration tree, the **show** command will display information for that node only.

---

## Examples

Example 1-5 configures an Ethernet interface by navigating down the configuration tree to the node for the interface, and editing from that location. The resulting commands are much simpler than if they were issued from the top of the configuration tree.

This example begins in operational mode and enters configuration mode.

### Example 1-5 Navigating with the “edit” command

---

```
vyatta@vyatta> configure
Entering configuration mode.
There are no other users in configuration mode.
vyatta@vyatta# edit interfaces ethernet eth0
[edit interfaces ethernet eth0]
vyatta@vyatta# set description "my interface 1"
[edit interfaces ethernet eth0]
vyatta@vyatta# set address 172.16.0.65 prefix-length 24
[edit interfaces ethernet eth0]
vyatta@vyatta# show
> description: "\"my interface 1\""
> address 172.16.0.65 {
>   prefix-length: 24
> }

[edit interfaces ethernet eth0]
vyatta@vyatta# commit
OK
[edit interfaces ethernet eth0]
```

---

# exit

Exits from this level of use to the level above.

This command is operationally equivalent to the **quit** command (see page 18).

---

## Command Mode

Configuration mode.

---

## Configuration Statement

`exit [discard]`

---

## Parameters

---

<b>discard</b>	Applies only at the top level of configuration. Exits from configuration mode, discarding all uncommitted configuration changes.
----------------	--

---

---

## Usage Guidelines

Use this command in configuration mode to move up one level of use:

- In configuration mode, using this command moves you up one level in the configuration tree.
- At the top level of configuration mode, using this command exits configuration mode, returning you to operational mode.

Use this command in operational mode to exit from the router shell to the UNIX command line.

If you try to exit from configuration mode while there are still uncommitted configuration changes, the system will give you a warning. You will not be able to exit from configuration mode until you either commit the changes by issuing the **commit** statement, or you discard the changes using the **exit discard** option. This is the only case where this option applies.

# help

Displays information describing what a command does and how to use it.

---

## Command Mode

Configuration mode.

Operational mode.

---

## Syntax

`help command`

---

## Parameters

<i>command</i>	Displays information about using the specified command.
----------------	---

---

## Usage Guidelines

Use this command to display brief information about the usage of a command.

---

## Examples

Example 1-6 gives an example of the usage of the **help** command. This example asks for help for the **show** command in configuration mode.

Example 1-6 The “help” command

```
vyatta@R1# help show
```

```
The "show" command will display all or part of the router configuration.
```

```
Without any parameters, the "show" command will display all of the router configuration below the current position in the command tree (See the
```

```
"edit" command for how to move the current position). The show command
```

```
can also take a part of the configuration as parameters; it will then show
```

```
only the selected part of the configuration.
```

```
Note that all configuration parameters that have default values are not
```

displayed.

If the configuration has been modified, any changes not yet committed will be highlighted. For example, if "show" displays:

```
    protocols {
        bgp {
>         peer 10.0.0.1 {
>             as: 65001
>         }
        }
```

then this indicates that the peer 10.0.0.1 has been created or changed, and the change has not yet been applied to the running router configuration.

--More--

---

# load

Loads configuration information from the specified file, discarding the current configuration.

---

## Command Mode

Configuration mode.

---

## Configuration Statement

`load file-name`

---

## Parameters

---

<i>file-name</i>	The name of the configuration file, including its location.
------------------	---

---

---

## Usage Guidelines

Use this command to instruct the router to manually load configuration from a file.

Configuration can be loaded from the local hard disk, a TFTP server, an FTP server, or an HTTP server. Note that loading a configuration file causes the previous running configuration to be discarded.

You can save a configuration file to a location other than the configuration directory, as shown in Table 1-2.

Table 1-1 Specifying locations for the configuration file

Location	Specification
An absolute path	
A relative path	Relative paths are interpreted relative to the path configured in the <b>config-directory</b> parameter of the <b>rtrmgr</b> configuration node.
A TFTP server	Use the following syntax for <i>file-name</i> : <b>tftp://ip-address/config-file</b> where <i>ip-address</i> is the IP address of the TFTP server, and <i>config-file</i> is the configuration file, including the path relative to the TFTP root directory.

Table 1-1 Specifying locations for the configuration file

Location	Specification
An FTP server	Use the following syntax for <i>file-name</i> : <b>ftp://ip-address/config-file</b> where <i>ip-address</i> is the IP address of the FTP server, and <i>config-file</i> is the configuration file, including the path. If you use FTP, you will be prompted for a user name and password.
An HTTP server	use the following syntax for file-name: <b>http://ip-address/config-file</b> where <i>ip-address</i> is the IP address of the HTTP server, and <i>config-file</i> is the configuration file, including the path.

Note that you cannot load an empty configuration file. The configuration file must contain at least one configuration node.

---

## Examples

Example 1-9 loads the configuration file **my-config.boot** from the **/opt/vyatta/etc/config** directory.

Example 1-7 Loading configuration from a file

---

```
vyatta@R1# load my-config.boot
[edit]
Load done.
vyatta@R1#
```

---

# quit

Exits from this level of use to the level above.

This command is operationally equivalent to the **exit** command (see page 13).

---

## Command Mode

Configuration mode.

Operational mode.

---

## Syntax

quit

---

## Parameters

None.

---

## Usage Guidelines

Use this command in configuration mode to move up one level of use:

- In configuration mode, using this command moves you up one level in the configuration tree.
- At the top level of configuration mode, using this command exits configuration mode, returning you to operational mode.

Use this command in operational mode to exit from the router shell to the UNIX command line.

If you try to quit from configuration mode while there are still uncommitted configuration changes, the system will give you a warning. You will not be able to exit from configuration mode until you either commit the changes by issuing the **commit** command (see page 6), or you discard the changes using the **exit discard** statement (see page 13).

# run

Runs the specified operational command without leaving configuration mode.

---

## Command Mode

Configuration mode.

---

## Syntax

`run command`

---

## Parameters

<i>command</i>	An operational command.
----------------	-------------------------

---

## Usage Description

Use this command to run an operational command without leaving configuration mode.

---

## Examples

Example 1-8 uses the **show host** command (an operational command) within configuration mode to view the system date and time.

Example 1-8 “run”: Using an operational command within configuration mode

---

```
vyatta@vyatta# run show host date
Wed Nov 30 16:36:58 PST 2005
[edit]
vyatta@vyatta#
```

---

# save

Saves the current configuration to the specified file.

---

## Command Mode

Configuration mode.

---

## Configuration Statement

*save file-name*

---

## Parameters

---

<i>file-name</i>	The name of the file where the information is to be saved, including its location.
------------------	--

---

---

## Usage Guidelines

Use this command to save the running configuration to a file.

The resulting file can later be loaded into the running router to replace the previous running configuration, using the **load** command (see page 16).

You can save a configuration file to a location other than the configuration directory, as shown in Table 1-2.

Table 1-2 Specifying locations for the configuration file

Location	Specification
An absolute path	
A relative path	Relative paths are interpreted relative to the path configured in the <b>config-directory</b> parameter of the <b>rtrmgr</b> configuration node.
A TFTP server	Use the following syntax for <i>file-name</i> : <b>tftp://ip-address/config-file</b> where <i>ip-address</i> is the IP address of the TFTP server, and <i>config-file</i> is the configuration file, including the path relative to the TFTP root directory.

---

Table 1-2 Specifying locations for the configuration file

Location	Specification
An FTP server	Use the following syntax for <i>file-name</i> : <b>ftp://ip-address/config-file</b> where <i>ip-address</i> is the IP address of the FTP server, and <i>config-file</i> is the configuration file, including the path. If you use FTP, you will be prompted for a user name and password.
An HTTP server	use the following syntax for file-name: <b>http://ip-address/config-file</b> where <i>ip-address</i> is the IP address of the HTTP server, and <i>config-file</i> is the configuration file, including the path.

If you overwrite a configuration file, the router retains one backup, using a *file-name~* convention. For example, if you save over **my-config.boot**, the router moves the previous file to **my-config.boot~**.

Note that the **save** command only writes committed changes. If you makes configuration changes, and try to save, the system warns you that you have uncommitted changes, and then saves only the committed changes.

## Examples

Example 1-9 saves the running configuration into the file **my-config.boot** in the **/opt/vyatta/etc/config** directory.

Example 1-9 Saving configuration to a file

```
vyatta@vyatta# save my-config.boot
[edit]
Save done.
vyatta@vyatta# exit
[edit]
vyatta@R1> show files /opt/vyatta/etc/config
total 24K
-rw-rw-r-- 1 vyatta xorp 2.8K Nov 28 10:30 config.boot
-rw-rw-r-- 1 vyatta xorp 2.8K Nov 27 14:32 config.boot~
-rw-rw-r-- 1 vyatta xorp 2.8K Nov 28 10:30 my-config.boot
-rw-rw-r-- 1 vyatta xorp 2.8K Nov 27 21:50 my-config.boot~
vyatta@R1>
```

Example 1-10 saves the current running configuration to the file **my-config.boot** in the root directory of a TFTP server at 10.1.0.35.

Example 1-10 “save”: Saving configuration to a file on a TFTP server

---

```
vyatta@vyatta# save tftp://10.1.0.35/my-config.boot
OK
[edit]
vyatta@vyatta#
```

---

# set

Creates a new configuration node, or changes a value in an existing configuration node.

---

## Command Mode

Configuration mode.

---

## Syntax

```
set parameter value
```

---

## Parameters

---

<i>parameter</i>	<p>The configuration node or property to be set, including the path to the node or property from the current location in the configuration tree.</p> <p>If the node or property does not exist, it is created. If the node or property already exists, the value is set to the new specified value.</p>
<i>value</i>	<p>The value to which the configuration node or property is to be set.</p> <p>Note that not all configuration nodes require values. For example,</p> <pre>set fea</pre> <p>does not require a value, while</p> <pre>set interfaces ethernet eth0</pre> <p>does require a value. See individual configuration items for details on the formats and supported values for each parameter.</p>

---

---

## Usage Guidelines

Use this command to add a configuration element to the current configuration—for example, to add a virtual interface to an interface. You can also use this command to set the value of an existing configuration item. When setting configuration values, note the following:

- The change does not take effect until the change is committed, using the **commit** command (see page 6).
- To navigate to a node for editing, use the **edit** command (see page 11) or the **up** command (see page 30), the **exit** command (see page 13), or the **quit** command (see page 18) as appropriate.

You must add a configuration node before you can change it or even view it. Before you add any configuration nodes, the system is essentially “empty” except for a few pre-defined configuration nodes. Trying to view system configuration at this stage will show nothing except for very basic system configuration such as a default host name.

Once a configuration node has been added, you can modify it later using the **set** command (see page 23), or delete it using the **delete** command (see page 9).

---

## Examples

Example 1-11 shows an example of the **set** command used to add new configuration for an Ethernet interface. The interface is created, along with a vif for the interface, and an IP address of 192.150.187.108 is applied to the vif. The network for the interface is defined as having a prefix length of 24.

After adding the configuration, the information is displayed and then committed.

### Example 1-11 “set”: Adding an Ethernet interface

---

```
vyatta@vyatta# set interfaces ethernet eth1 vif 0 address
192.150.187.108 prefix-length 24
OK
[edit]

vyatta@vyatta# show interfaces ethernet eth1
> vif 1 {
>     description: ""
>     address 192.150.187.108 {
>         prefix-length: 24
>         broadcast: 192.150.187.255
>     }
> }

[edit]

vyatta@vyatta# commit
OK

[edit]
vyatta@vyatta#
```

---

# show

Displays configuration information (configuration mode) or system information (operational mode).

---

## Command Mode

Configuration mode.

Operational mode.

---

## Syntax

```
show config-node          /* Configuration mode
show sub-command         /* Operational mode
```

---

## Parameters

<i>config-node</i>	Available only in configuration mode.  The configuration node you want to view, including the path relative to your current location in the configuration tree. The node must exist.
<i>sub-command</i>	Available only in operational mode.  A valid operational <b>show</b> command; these vary with different router functionalities. See individual router functions for details.

---

## Usage Guidelines

Use this command in configuration mode to display the configured state of the router. Use this command in operational mode to view various aspects of the running router.

In configuration mode, this command displays all existing configuration nodes and sub-nodes starting from your current location in the configuration tree. When used with a configuration path, this command displays the specified configuration node and all its sub-nodes. Default information is not shown.

There are a number of **show** commands in operational mode.

You can only view information for system functions that have been created and configured on the router. Therefore, the **show** commands actually available to you will vary depending on your configuration. Please see individual router functions for specific **show** commands.

If you try to show information for functions that have not been configured, the router gives an error. For example, if you try to use **show rip peers** before creating the **protocols rip** configuration node, the system responds with an error, as shown in Example 1-14.

---

## Examples

Example 1-12 shows the **show** commands available in operational mode.

Example 1-12 Show commands available in operational mode

---

```
vyatta@R1> show ?
Possible completions:
  arp          Show Address Resolution Protocol information
  bridge       Show bridging information
  configuration show current system configuration
  dhcp         Show Dynamic Host Configuration Protocol
               information
  files        Show file information
  firewall     Show firewall information
  hardware     Show system hardware details
  host         Show host information
  igmp         Display information about IGMP
  interfaces   Show system interfaces
  log          Show contents of master log file
  mfea         Show IPv4 MFEA information
  nat          Show Network Address Translation information
  ntp          Show Network Time Protocol information
  package      Show information about system packages
  route        Show routing table information
  snmp         Show Simple Network Management Protocol
               information
  system       Show system information
  tech-support Consolidated tech-support report
  users        Show user information
  version      Show software revision information
  vrrp         Show Virtual Router Redundancy Protocol
               information

vyatta@mercury> show
```

Example 1-13 shows the **show** command used in configuration mode. In this example, the configuration node displayed is the **service** node.

Example 1-13 Show command in configuration mode

---

```
vyatta@vyatta# show service
dhcp-server {
}
dhcp {
}
```

```
    http {
    }
    ssh {
    }
    telnet {
    }

[edit]
vyatta@vyatta#
```

---

Example 1-14 shows the error displayed if you try to show information for functions that have not been configured. In this example, the **show rip peers** command is not recognized, because the **protocols rip** configuration node has not yet been created.

---

**Example 1-14** Error in showing unconfigured functions

---

```
vyatta@vyatta# show protocols
ospf4 {
  router-id: 10.1.0.54
  area 0.0.0.0 {
    interface eth0 {
      address 10.1.0.54 {
        authentication {
          md5 1 {
            password: "testmd5"
          }
        }
      }
    }
  }
}

[edit]
vyatta@vyatta# exit
[edit]
vyatta@R1> show rip ?
syntax error, command "show rip" is not recognized.
vyatta@R1> configure
Entering configuration mode.
There are no other users in configuration mode.
vyatta@R1# set protocols rip
[edit]
vyatta@R1# commit
[edit]
OK
vyatta@R1> exit
```

```
[edit]
vyatta@R1> show rip ?
Possible completions:
  peer          Show RIP statistics for all peers
  statistics    -- No help available --
  status        -- No help available --
vyatta@R1> show rip
```

---

Sometimes, the configuration information will be too long for your screen, and the screen will show the “More” indication where the information breaks.

- To display the next line of configuration information when the “More” indication is showing, press **<Enter>**.
- To page forward one page, press **<Space>**.
- To page backward, press **b**.
- When all the output has been displayed, the “END” flag appears beside the “More” indicator. Press **q** to exit from the “More” display, as shown in Example 1-15.

---

#### Example 1-15 Exiting a “More” screen

---

```
[edit]
--More-- (END) q
vyatta@vyatta#
```

---

To turn off paging, pipe your command through the UNIX **no-more** option, as in Example 1-16.

---

#### Example 1-16 Exiting a “More” screen

---

```
vyatta@vyatta> show route | no-more
```

---

# top

Exits to the top level of configuration mode.

---

## Command Mode

Configuration mode.

---

## Configuration Statement

top

---

## Parameters

None.

---

## Usage Guidelines

Use this command to quickly navigate to the top level of configuration mode.

---

## Examples

Example 1-17 navigates down through several nodes of the configuration tree, then uses the **top** command to jump directly to the top of the tree. In this example, notice how the **[edit]** line displays your location in the configuration tree.

Example 1-17 “top”: Navigating to the top of the configuration tree

---

```
vyatta@vyatta# edit protocols rip interface eth0
[edit protocols/rip/interface/eth0]
vyatta@vyatta# top
[edit]
vyatta@vyatta#
```

---

# up

Navigates up one level in the configuration tree.

---

## Command Mode

Configuration mode.

---

## Configuration Statement

up

---

## Parameters

None.

---

## Usage Guidelines

Use this command to navigate one level up in configuration mode.

---

## Examples

Example 1-18 navigates down through several nodes of the configuration tree, then uses the **up** command to navigate successively higher in the tree. In this example, notice how the **[edit]** line displays your location in the configuration tree.

Example 1-18 “up”: Navigating up through the configuration tree

---

```
vyatta@vyatta# edit protocols rip interface eth0
[edit protocols/rip/interface/eth0]
vyatta@vyatta# up
[edit protocols/rip/interface]
vyatta@vyatta#
[edit protocols/rip/]
```

---

## Chapter 2: System Management

This chapter describes commands required for basic system management tasks.

This chapter contains the following commands.

Command	Mode	Description
<code>clear arp</code>	Operational	Clears the ARP cache.
<code>date</code>	Operational	Allows you to manually set the system clock or synchronize it one time with an NTP server .
<code>init-floppy</code>	Operational	Formats a floppy diskette and prepares it to receive a configuration file.
<code>mount</code>	Operational	Mounts the floppy disk file system.
<code>reboot</code>	Operational	Reboots the router.
<code>rtrmgr</code>	Configuration	Allows you to change the default location for configuration files.
<code>show arp</code>	Operational	Displays the ARP cache.
<code>show files</code>	Operational	Lists the files in the specified directory.
<code>show host</code>	Operational	Displays host information for hosts reachable by the router.
<code>show interfaces</code>	Operational	Displays information about interfaces.
<code>show ntp associations</code>	Operational	Shows the status of configured NTP servers.
<code>show system boot-messages</code>	Operational	Displays boot messages generated by the kernel.
<code>show system connections</code>	Operational	Displays active network connections on the system.
<code>show system kernel-messages</code>	Operational	Displays messages in the kernel ring buffer.
<code>show system memory</code>	Operational	Displays system memory usage.
<code>show system processes</code>	Operational	Displays active system processes.
<code>show system storage</code>	Operational	Displays system file system usage and available storage space.
<code>show version</code>	Operational	Displays information about the version of router software.
<code>system domain-name</code>	Configuration	Defines the router's domain.
<code>system domain-search</code>	Configuration	Defines a set of domains for domain completion.
<code>system host-name</code>	Configuration	Sets the host name for the router.

Command	Mode	Description
<code>system name-server</code>	Configuration	Specifies the DNS name servers available to the router.
<code>system ntp-server</code>	Configuration	Specifies the NTP servers to use when synchronizing the router's clock.
<code>system static-host-mapping</code>	Configuration	Defines a static mapping between a host name and an IP address.
<code>system time-zone</code>	Configuration	Sets the time zone for the local system clock.

*See also* the following commands in other chapters.

<code>show interfaces ethernet</code>	Operational	Displays information or statistics about Ethernet interfaces. <i>See page 102.</i>
<code>show interfaces serial</code>	Operational	Displays information about a specific serial interface. <i>See page 125.</i>

# clear arp

Clears the ARP cache.

---

## Command Mode

Operational mode.

---

## Syntax

```
clear arp [interface eth0..eth23 |  
          address ipv4]
```

---

## Parameters

<b>interface</b>	Clears the entire ARP cache for the specified Ethernet interface. The range of values is <b>eth0</b> to <b>eth23</b> .
<b>address</b>	Removes the ARP entry for the specified IP address from the ARP cache.

---

## Usage Guidelines

Use this command to clear remove ARP entries associated with an Ethernet interface, or to remove the entry associated with a specific IP address from the ARP cache.

# date

Allows you to manually set the system clock or synchronize it one time with an NTP server

.

---

## Command Mode

Operational mode.

---

## Syntax

```
date {date-time |  
      ntp ipv4}
```

---

## Parameters

<i>date-time</i>	Manually sets the system time and date. The format is “ <i>MMDDhhmm[.ss]YYYY</i> ”, where <i>MM</i> is a month from 01 to 12, <i>DD</i> is a day from 0 to 31, <i>hh</i> is an hour from 00 to 24, <i>mm</i> is minutes from 00 to 59, <i>ss</i> is seconds from 00 to 59, and <i>YYYY</i> is the year. Specifying seconds is optional; the other values are all required. The string must be enclosed in double quotes.
<b>ntp</b>	Instructs the system to synchronize the system time and date with the NTP server one time at the specified IP address. The server must be specified as an IPv4 address.

---

## Usage Guidelines

Use this command to set the system clock.

When used with no option, this command manually sets the system clock to the specified date and time. When used with the **ntp** option, this command manually updates the system clock from the specified NTP server. The system echoes the set date and time on the console for you to verify.

Time zone cannot be set using this command. To set time zone, use the **system time-zone** command (see page 75).

You can configure the router to always automatically obtain the system date and time from one or more NTP servers using the **system ntp-server** command (see page 72).

# init-floppy

Formats a floppy diskette and prepares it to receive a configuration file.

---

## Command Mode

Operational mode.

---

## Syntax

`init-floppy`

---

## Parameters

None.

---

## Usage Guidelines

Use this command to format a disk in the floppy disk drive.

The system puts a file system on the floppy disk and makes it accessible to the Vyatta system. It also saves a copy of the running configuration to **/mnt/floppy/config/config.boot**.

Initializing the floppy disk erases any previous data on the disk. The system reminds you of this, and provides a 5-second window in which you can quit out of the command by typing <Ctrl>+c.

Once the floppy disk has been formatted, you can save the **config.boot** configuration file to disk using the **save** command (see page 20).

---

## Examples

Example 2-1 prepares a floppy disk for receiving a configuration file and saves the running configuration to **/mnt/floppy/config/config.boot**.

Example 2-1 “init-floppy”: Preparing a floppy diskette for a configuration file

---

```
vyatta@R1> init-floppy
This will erase all data on floppy /dev/fd0.
<CTRL>C to exit: 5
Formatting floppy /dev/fd0...

Floppy disk initialized.
vyatta@R1>
```

---

# mount

Mounts the floppy disk file system.

---

## Command Mode

Operational mode.

---

## Configuration Statement

```
mount floppy
```

---

## Parameters

None.

---

## Usage Guidelines

Use this command to mount the floppy disk file system.

# reboot

Reboots the router.

---

## Command Mode

Operational mode.

---

## Syntax

reboot

---

## Parameters

None.

---

## Usage Guidelines

Use this command to reboot the router.

---

## Examples

Example 2-2 reboots the router.

Example 2-2 “reboot”: Rebooting the router

---

```
vyatta@R1> reboot
The system is going down NOW !!
Sending SIGTERM to all processes.
Terminated
Sending SIGKILL to all processes.
Please stand by while rebooting the router.
```

---

# rtrmgr

Allows you to change the default location for configuration files.

---

## Command Mode

Configuration mode.

---

## Syntax

<code>set rtrmgr text ...</code>	Sets default configuration parameters for the XORP <b>rtrmgr</b> process.
<code>delete rtrmgr ...</code>	The <b>rtrmgr</b> configuration node is mandatory and cannot be deleted. If you delete the <b>rtrmgr</b> node, configuration is reset to default.

---

## Configuration Statement

```
rtrmgr {  
    config-directory: text  
}
```

---

## Parameters

<b>config-directory</b>	Sets the default location of the configuration file. This location is where the Vyatta OFR will look to read the <b>config.boot</b> configuration file on startup.  The default is <b>/opt/vyatta/etc/config</b> .
-------------------------	--

---

## Usage Guidelines

Use this command to change the directory where the router looks to load the **config.boot** configuration file on startup.

# show arp

Displays the ARP cache.

---

## Command Mode

Operational mode.

---

## Syntax

```
show arp
```

---

## Parameters

None.

---

## Usage Guidelines

Use this command to see the entries in the ARP cache.

Table 2-1 shows possible ARP states.

Table 2-1 ARP states

State	Description
<b>incomplete</b>	Address resolution is currently being preformed on this neighbor entry.
<b>reachable</b>	Indicates that the neighbor is reachable. Positive confirmation has been received and the path to this neighbor is operational.
<b>stale</b>	More than the configured elapsed time has passed since reachability confirmation was received from this neighbor.
<b>delay</b>	More than the configured elapsed time has passed since reachability confirmation was received from this neighbor. This state allows TCP to confirm the neighbor. If not, a probe should be sent after the next delay time has elapsed.
<b>probe</b>	A solicitation has been sent and the router is waiting for a response from this neighbor.
<b>failed</b>	Neighbor reachability state detection failed.

Table 2-1 ARP states

State	Description
<b>noarp</b>	This is a pseudo-state, indicating that ARP is not used for this neighbor entry.
<b>permanent</b>	This is a pseudo-state indicating that this entry should not be cleared from the cache.
<b>none</b>	No state is defined.

---

## Examples

Example 2-3 shows the ARP cache of router R1.

Example 2-3 “show arp”: Displaying the ARP cache

---

```
vyatta@R1> show arp
MAC Address          IP Address      State  Interface
-----
00:12:D9:74:BE:91    172.16.215.1   reach  eth1
00:04:23:09:0F:79    10.1.0.1       reach  eth0

vyatta@R1>
```

---

# show configuration

Displays system configuration.

---

## Command Mode

Operational mode.

---

## Syntax

```
show [-all] configuration
```

---

## Parameters

---

<b>-all</b>	Displays all configuration, including default values that would not normally be displayed.
-------------	--

---

---

## Usage Guidelines

Use this command to list configuration information.

Using **show configuration** in operational is equivalent to using **show** in configuration mode. You can display any configuration node by specifying the path for the node. For example, show **configuration firewall** in operational mode is equivalent to **show firewall** in configuration mode.

---

## Examples

Example 2-4 displays the **firewall** configuration node from operational mode.

Example 2-4 “show configuration”: Displaying the configuration tree in operational mode

---

```
vyatta@R1> show configuration firewall
  log-martians: "enable"
  send-redirects: "disable"
  receive-redirects: "disable"
  ip-src-route: "disable"
  broadcast-ping: "disable"
  syn-cookies: "enable"

vyatta@R1>
```

---

# show files

Lists the files in the specified directory.

---

## Command Mode

Operational mode.

---

## Syntax

```
show files [directory]
```

---

## Parameters

<i>directory</i>	The name of the directory, including the relative or absolute path to the directory.
------------------	--

---

## Usage Guidelines

Use this command to list files.

When used with no option, this command lists files in the current directory. When a path is provided, this command lists files in the specified directory.

---

## Examples

Example 2-5 lists the files in the **/usr** directory.

Example 2-5 “show files”: Listing files in the file system

```
vyatta@R1> show files /usr
total 48K
drwxr-xr-x  2 root root   12K Dec  7 09:33 bin
drwxr-xr-x  2 root root   4.0K Nov  3 11:26 games
drwxr-xr-x  2 root root   4.0K Nov  3 11:23 include
drwxr-xr-x 27 root root   12K Dec  7 09:33 lib
drwxrwsr-x 10 root staff  4.0K Sep 25 14:43 local
drwxr-xr-x  2 root root   4.0K Dec  7 09:42 sbin
drwxr-xr-x 47 root root   4.0K Dec  7 09:33 share
drwxrwsr-x  2 root src    4.0K Aug 28 10:59 src
vyatta@R1>
```

# show hardware cpu

Displays information about the router's processor.

---

## Command Mode

Operational mode.

---

## Syntax

```
show hardware cpu
```

---

## Parameters

None.

---

## Usage Guidelines

Use this command to view information about the processor used in the router's hardware platform.

---

## Examples

Example 2-6 shows CPU information on router R1.

Example 2-6 "show hardware cpu": Showing CPU information

---

```
vyatta@R1> show hardware cpu
processor           : 0
vendor_id          : GenuineIntel
cpu family         : 15
model              : 2
model name         : Intel(R) Celeron(R) CPU 2.00GHz
stepping           : 9
cpu MHz            : 1996.821
cache size         : 128 KB
fdiv_bug           : no
hlt_bug            : no
f00f_bug           : no
coma_bug           : no
fpu                : yes
fpu_exception      : yes
cpuid level        : 2
wp                 : yes
```

```
flags          : fpu vme de pse tsc msr pae mce cx8 apic sep
mtrr pge mca cmov pat pse36 clflush dts acpi mmx fxsr sse sse2
ss ht tm pbe cid xtpr
bogomips       : 3999.60
vyatta@R1>
```

---

# show hardware mem

Displays information about the memory used in the router's hardware platform.

---

## Command Mode

Operational mode.

---

## Syntax

```
show hardware mem
```

---

## Parameters

None.

---

## Usage Guidelines

Use this command to display information about the memory used in the router's hardware platform

---

## Examples

Example 2-7 shows information about the memory used in router R1.

Example 2-7 "show hardware mem": Showing hardware memory information

---

```
vyatta@R1> show hardware mem
MemTotal:      256280 kB
MemFree:       121384 kB
Buffers:       19240 kB
Cached:        64256 kB
SwapCached:    0 kB
Active:        77408 kB
Inactive:      38512 kB
HighTotal:     0 kB
HighFree:      0 kB
LowTotal:      256280 kB
LowFree:       121384 kB
SwapTotal:     0 kB
SwapFree:      0 kB
Dirty:         0 kB
Writeback:     4 kB
Mapped:        50112 kB
Slab:          16312 kB
```

```
CommitLimit:      128140 kB
Committed_AS:      49328 kB
PageTables:        752 kB
VmallocTotal:      770040 kB
VmallocUsed:        1740 kB
VmallocChunk:      768092 kB
vyatta@R1>
```

---

# show host

Displays host information for hosts reachable by the router.

---

## Command Mode

Operational mode.

---

## Syntax

```
show host [hostname / name | date | os]
```

---

## Parameters

<i>host-name</i>	Shows DNS and IP address information about the specified host. This option can be used with either the host name or the IP address of the router. In either case, this command displays the name server canonical name of and IP address of the host, plus any configured aliases.
<b>name</b>	Shows the name configured for this router.
<b>date</b>	Shows the date and time according to the system clock.
<b>os</b>	Shows details about the router's operating system.

---

## Usage Guidelines

Use this command to view information configured for the host.

The information displayed by this command can be configured using the **system host-name** command (see page 70).

---

## Examples

Example 2-8 shows host information for router R2.

Example 2-8 “show host”: Finding information about network hosts

---

```
vyatta@R1> show host R2
Server:          10.0.0.31
Address:         10.0.0.31#53

Name:   R2.vyatta.com
Address: 10.1.0.3

vyatta@R1>
```

---

Example 2-9 shows the name configured for router R1.

Example 2-9 “show host name”: Finding the names of network hosts

---

```
vyatta@R1> show host name
R1
vyatta@R1>
```

---

Example 2-10 shows the date and time according to the system clock.

Example 2-10 “show host name”: Showing the system date and time

---

```
vyatta@R1> show host date
Sun Dec 10 01:04:49 PST 2006
vyatta@R1>
```

---

Example 2-11 shows information about the operating system.

Example 2-11 “show host os”: Showing operating system information

---

```
vyatta@R1> show host date
Linux mercury 2.6.16 #1 Tue Dec 5 15:56:41 PST 2006 i686
GNU/Linux
vyatta@R1>
```

---

# show interfaces

Displays information about interfaces.

---

## Command Mode

Operational mode.

---

## Syntax

```
show interfaces [system [enabled]]
```

---

## Parameters

<b>system</b>	Displays all system interfaces known to the Linux kernel.
<b>enabled</b>	Shows only enabled interfaces known to the Linux kernel.

---

## Usage Guidelines

Use this command to view configuration information and operational status for interfaces and vifs.

When used with no option, this statement displays information for all interfaces configured on the router. You can see specific information by using other, more detailed, versions of this command:

- To see information for Ethernet interfaces, use the **show interfaces ethernet** version. This command is described in full in “Chapter 3: Ethernet Interfaces, VLANs, and Bridging.”
- To see information for serial interfaces, use the **show interfaces serial** version. This command is described in full in “Chapter 4: Serial Interfaces.”

To see all the physical interfaces known to the operating system kernel, use the **system** option. This option differs from the other options in that the others show interfaces that have been configured on the router (and where the configuration has been committed), while this option shows all the interfaces that are available on your system. You can use this information to determine the interfaces you can configure (for example, how many Ethernet interfaces your system has, or whether it has serial interfaces). It will also show you the syntax for the interface types (Ethernet, serial, and so on).

- When used with no option, the **system** option shows all interfaces available for configuration.

- When used with the **enabled** option, the **system** option shows system interfaces that have been enabled through configuration.

---

## Examples

Example 2-12 shows the first screen of output for **show interfaces system enabled**.

Example 2-12 “show interfaces”: Displaying interface information

---

```
vyatta@R1> show interfaces system enabled
eth0      Link encap:Ethernet  HWaddr 00:30:48:84:B2:BC
          inet addr:10.1.0.54  Bcast:10.1.0.255
          Mask:255.255.255.0
          inet6 addr: fe80::230:48ff:fe84:b2bc/64 Scope:Link

--More--
```

---

## show ntp associations

Shows the status of configured NTP servers.

---

### Command Mode

Operational mode.

---

### Syntax

```
show ntp associations [no-resolve]
```

---

### Parameters

---

<b>no-resolve</b>	Do not attempt to resolve IP addresses into domain names. Use this option to reduce the amount of time it takes for this command to return a result.
-------------------	---

---

---

### Usage Guidelines

Use this command to view the status of connections to configured NTP servers.

A line entry is given for each configured NTP server, showing the server's IP address and how often the router is polling and updating to the NTP clock. An asterisk (\*) next to the NTP server's IP address indicates successful synchronization with the NTP server.

When this command is used without the no-resolve option, the router will attempt to resolve all IP addresses in the configuration to DNS names. This can significantly increase the amount of time required for the command to return a result. To decrease the delay, use the **no-resolve** option.

NTP server connections are configured using the **system ntp-server** command (see page 72).

---

## Examples

Example 2-13 shows the NTP server configured for R1.

Example 2-13 “show ntp associations”: Showing configured NTP servers

---

```
vyatta@R1> show ntp associations
      remote          refid      st t when poll reach  delay  offset  jitter
=====
archive.vyatta. .INIT.        16 u  29h 1024    0   0.000   0.000 4000.00
vyatta@R1>
```

---

# show system boot-messages

Displays boot messages generated by the kernel.

---

## Command Mode

Operational mode.

---

## Syntax

```
show system boot-messages
```

---

## Parameters

None.

---

## Usage Guidelines

Use this command to see startup messages that have been generated by the kernel.

---

## Examples

Example 2-14 shows the first screen of output for **show interfaces system enabled**.

Example 2-14 “show system boot-messages”: Displaying startup messages

---

```
vyatta@R1> show system boot-messages

# show system connections

Displays active network connections on the system.

## Command Mode

Operational mode.

## Syntax

```
show system connections
```

## Parameters

None.

## Usage Guidelines

Use this command to see what network connections are currently active on the network.

## Examples

Example 2-15 shows the first screen of output for **show system connections**.

Example 2-15 “show system connections”: Displaying active connections

```
vyatta@R1> show system connections
Active Internet connections (servers and established)
Proto Recv-Q Send-Q Local Address           Foreign Address         State
tcp        0      0 localhost:2912          :::*                    LISTEN
tcp        0      0 localhost:3777          :::*                    LISTEN
tcp        0      0 localhost:2177          :::*                    LISTEN
tcp        0      0 localhost:1700          :::*                    LISTEN
tcp        0      0 localhost:1893          :::*                    LISTEN
tcp        0      0 localhost:4165          :::*                    LISTEN
tcp        0      0 localhost:4744          :::*                    LISTEN
tcp        0      0 localhost:34281         :::*                    LISTEN

---

# show system kernel-messages

Displays messages in the kernel ring buffer.

---

## Command Mode

Operational mode.

---

## Syntax

```
show system kernel-messages
```

---

## Parameters

None.

---

## Usage Guidelines

Use this command to see messages currently residing in the kernel ring buffer.

---

## Examples

Example 2-16 shows the first screen of output for **show system kernel-messages**.

Example 2-16 “show system kernel-messages”: Displaying messages from the kernel

```
vyatta@R1> show system kernel-messages
Linux version 2.6.16 (autobuild@phuket.vyatta.com) (gcc version
4.1.1) #1 Tue Dec 5 15:56:41 PST 2006
BIOS-provided physical RAM map:

# show system memory

Displays system memory usage.

---

## Command Mode

Operational mode.

---

## Syntax

```
show system memory
```

---

## Parameters

None.

---

## Usage Guidelines

Use this command to see how much memory is currently being used by the system, and how much is free.

---

## Examples

Example 2-14 shows information about memory usage on router R1.

Example 2-17 “show system memory”: Displaying information about memory usage

---

```
vyatta@R1> show system memory
total      used      free      shared    buffers    cached
Mem:      256280    136732    119548         0      19540     65772
Swap:         0         0         0
Total:      256280    136732    119548
vyatta@R1>
```

---

# show system processes

Displays active system processes.

---

## Command Mode

Operational mode.

---

## Syntax

```
show system processes [summary]
```

---

## Parameters

Parameter	Description
<b>summary</b>	Provides a summary of process information.

---

## Usage Guidelines

Use this command to see a list of processes currently running on the system.

When used with the **summary** option, this command shows a summary of system process information.

---

## Examples

Example 2-18 shows the first screen of output for **show system processes**.

Example 2-18 “show system processes”: Displaying process information

---

```
vyatta@R1> show system processes
PID TTY      STAT   TIME COMMAND
   1 ?        S       0:01 init [2]

---

# show system storage

Displays system file system usage and available storage space.

---

## Command Mode

Operational mode.

---

## Syntax

```
show system boot-messages
```

---

## Parameters

None.

---

## Usage Guidelines

Use this command to see how much storage space is currently being used by the system, and how much is free.

---

## Examples

Example 2-19 shows file system usage information for router R1.

Example 2-19 “show system storage”: Displaying file system and storage information

---

```
vyatta@R1> show system storage
Filesystem      Size  Used Avail Use% Mounted on
rootfs          953M  287M  618M  32% /
udev            10M   28K   10M   1% /dev
/dev/hda1        953M  287M  618M  32% /
/dev/hda1        953M  287M  618M  32% /dev/.static/dev
tmpfs           126M   4.0K  126M   1% /dev/shm
/dev/hda2        9.7M  1.5M  7.8M  17% /opt/vyatta/etc/config
vyatta@R1>
```

---

# show tech-support

Provides a consolidated report of system information.

---

## Command Mode

Operational mode.

---

## Syntax

```
show system tech-report
```

---

## Parameters

None.

---

## Usage Guidelines

Use this command to list a technical report providing consolidated information about system components and configuration.

This information is valuable for debugging and diagnosing system issues. You should provide the technical report whenever you open a case with Vyatta technical support.

---

## Examples

Example 2-20 shows the first screen of a technical report.

Example 2-20 “show tech-support” Displaying consolidated system information

```
vyatta@R1> show tech-support

# show version

Displays information about the version of router software.

---

## Command Mode

Operational mode.

---

## Syntax

```
show version
```

---

## Parameters

None.

---

## Usage Guidelines

Use this command to display information about the version of router software the router is running.

Example 2-21 show sample output for the **show version** command.

Example 2-21 “show version”: Displaying router software information

---

```
vyatta@vyatta> show version
Version:      1.1-1
Built by:     autobuild@vyatta.com
Built on:     200612060031 -- Wed Dec  6 00:31:13 UTC 2006
System booted: Fri Dec  8 15:36:39 PST 2006

```

---

# system domain-name

Defines the router's domain.

---

## Command Mode

Configuration mode.

---

## Syntax

`set system domain-name ...`      Creates or modifies the configuration node for the router's domain.

`delete system domain-name ...`      Deletes domain configuration.

---

## Configuration Statement

```
system {  
    domain-name: text  
}
```

---

## Parameters

<b>domain-name</b>	Mandatory. The domain where the router resides. The format is a string containing letters, numbers, hyphens (“-”) and a period.
--------------------	---

---

## Usage Guidelines

This statement is optional. Use this command configure the router's domain—for example, **mydomain.com**.

# system domain-search

Defines a set of domains for domain completion.

---

## Command Mode

Configuration mode.

---

## Syntax

<pre>set system domain-search domain text ...</pre>	Adds a domain to the list of domains. Note that you cannot use set to change a domain. To change a domain, <b>delete</b> the incorrect domain and <b>set</b> a new one to replace it.
<pre>delete system domain-search domain text ...</pre>	Deletes the specified domain from the list.

---

## Configuration Statement

```
system {  
    domain-search {  
        domain: text [text ...]  
    }  
}
```

---

## Parameters

<b>domain</b>	<p>Mandatory. Multi-node. A domain name to be added to or deleted from the list of domains in the search order string. The format is a string specifying a domain, for example <b>mydomain.com</b>. Letters, numbers, hyphens (“-”) and a period (“.”) are allowed.</p> <p>You can enter up to six domains by issuing this command up to six times, to a maximum of 256 characters. Alternatively, up to six domains can be specified in a space-separated list, to a maximum of 256 characters.</p>
---------------	--

---

## Usage Guidelines

Use this command to set the order for domain completions of DNS lookup requests.

When the router receives an unqualified host name, the domain names specified here are appended to the host name to form a Fully Qualified Domain Name. The router tries each domain name in turn, in the order in which they were configured. If none of the resulting FQDNs succeeds, the name will not be resolved and an error will be reported.

You can specify up to six domains by issuing the **set** command multiple times. Alternatively, you can specify up to domain names in a space-separated list, to a maximum of 256 characters.

Note that you cannot use **set** to change a domain name in the list. To change an incorrect domain, delete it and replace it with a new one.

# system host-name

Sets the host name for the router.

---

## Command Mode

Configuration mode.

---

## Syntax

`set system host-name text ...` Creates the configuration node for the router host name, or changes the router's host name. As the router is automatically provided with a default host name, this node will normally exist already.

`delete system host-name text ...` Resets the router's host name to the default.

---

## Configuration Statement

```
system {  
    host-name: text  
}
```

---

## Parameters

<i>text</i>	The name you want to give the router. Letters, numbers, and hyphens (“-”) only are allowed.  The default is “vyatta”. If you delete the host name, or if you try to delete the <b>system</b> node, the host name reverts to the default.
-------------	--

---

## Usage Guidelines

Use this command to configure a host name for the router.

By default, the host name is preconfigured to “vyatta”. If you delete the host name, or if you delete the **system** node, the default values are restored.

When you set this value, the command prompt changes to reflect the new host name. To see the change in the prompt, you must log out of the router shell and log back in again.

# system name-server

Specifies the DNS name servers available to the router.

---

## Command Mode

Configuration mode.

---

## Syntax

<code>set system name-server ipv4 ...</code>	Defines a new DNS name server. You can define multiple DNS servers by issuing the <b>set</b> command multiple times.  You cannot use <b>set</b> to change the identifier of an existing name server. To change the IP address of a DNS server, <b>delete</b> the server configuration and <b>set</b> a new one with the correct address.
<code>delete system name-server   ipv4 ...</code>	Removes a defined DNS name server.

---

## Configuration Statement

```
system {  
  name-server: ipv4 {}  
}
```

---

## Parameters

<i>ipv4</i>	Multi-node. The IPv4 address of a DNS name server to use for local name query requests.  You can specify multiple DNS name servers by creating multiple instances of the <b>name-server</b> configuration node.
-------------	---

---

## Usage Guidelines

Use this command to specify DNS name servers for the router.

To add a DNS name server, use the **set** version of this statement. To remove a DNS name server, use the **delete** version of this statement. More than one name server can be specified by issuing the **set system name-server** statement multiple times.

To change the IP address for a DNS server, delete it and recreate it using the correct address.

## system ntp-server

Specifies the NTP servers to use when synchronizing the router's clock.

---

### Command Mode

Configuration mode.

---

### Syntax

<code>set system ntp-server ipv4 ...</code>	<p>Adds a server to the list of NTP servers. You can specify multiple NTP servers by issuing the <b>set</b> command multiple times.</p> <p>You cannot use <b>set</b> to change the address of an existing NTP server. To change the IP address of an NTP server, <b>delete</b> the server and <b>set</b> a new one to replace it.</p>
<code>delete system ntp-server ipv4 ...</code>	<p>Deletes the specified NTP server from the list of servers.</p>

---

### Configuration Statement

```
system {  
  ntp-server: [ipv4/text] {}  
}
```

---

### Parameters

<b>ntp-server</b>	<p>Multi-node. The IP address or host name of an NTP server. The router will automatically obtain the system date and time from the specified server(s). The default is <b>ntp.vyatta.com</b>.</p> <p>You can specify multiple NTP servers by creating multiple instances of the <b>name-server</b> configuration node.</p>
-------------------	---

---

### Usage Guidelines

Use this command to specify NTP servers for the router.

To add an NTP server, use the **set** version of this command. To remove an NTP server, use the **delete** version of this statement. More than one NTP server can be specified by issuing the **set system ntp-server** statement multiple times.

To change the IP address for an NTP server, delete it and recreate it using the correct address.

# system static-host-mapping

Defines a static mapping between a host name and an IP address.

---

## Command Mode

Configuration mode.

---

## Syntax

```
set system static-host-mapping  
  host-name ...
```

Use **set** to create a new static mapping between a host name and an IP address, or to modify static mapping values.

Note that you cannot use **set** to change the host name, as it is the identifier of the configuration node. To change the host name, **delete** the mapping entry and **set** a new one with the correct host name.

```
delete system static-host-mapping  
  host-name ...
```

Use **delete** to remove the **alias** portion of a mapping, or to remove the entire mapping entry. You cannot delete the **inet** value by itself, as it is mandatory.

---

## Configuration Statement

```
system {  
  static-host-mapping {  
    host-name: text {  
      inet: ipv4  
      alias: text {}  
    }  
  }  
}
```

---

## Parameters

<b>host-name</b>	Multi-node. The fully qualified host name being statically mapped to an IP address (for example, <b>router1@mydomain.com</b> ). Letters, numbers, periods (“.”) and hyphens (“-”) only are allowed.  To define multiple mappings, set multiple <b>host-name</b> configuration nodes within the <b>static-host-mapping</b> node.
<b>inet</b>	Mandatory. The IPv4 address of the interface being statically mapped to the host name.

---

<b>alias</b>	Optional. Multi-node. An alias for the interface. Letters, numbers, and hyphens are allowed.  You can define multiple aliases for a host by creating multiple <b>alias</b> configuration nodes.
--------------	---

---

---

### Usage Guidelines

Use this command to statically map a host name to an IP address and one or more aliases.

# system time-zone

Sets the time zone for the local system clock.

---

## Command Mode

Configuration mode.

---

## Syntax

<code>set system time-zone <i>text</i> ...</code>	Use <b>set</b> to set the time zone for the first time, or to change the time zone setting.
<code>delete system time-zone <i>text</i> ...</code>	Use <b>delete</b> to remove the time zone setting. This restores the time zone to the default (GMT).

---

## Configuration Statement

```
system {  
    time-zone: text  
}
```

---

## Parameters

---

<i>time-zone</i>	<p>A string representing the time-zone and offset from UTC, enclosed in double quotes.</p> <p>The format is “<b>GMT</b> [{+   -} <i>h</i>]”, where <i>h</i> is a number from 1 to 12 representing the hours offset from GMT. The string must be enclosed in double quotes.</p> <p><b>Calculating offset from GMT:</b> Please see the “Usage Guidelines” section for this information.</p> <p>The following time zone names, enclosed in double quotes, are also accepted:</p> <p>“<b>Los Angeles</b>”: Sets the time zone to Los Angeles time.</p> <p>“<b>New York</b>”: Sets the time zone to New York time.</p> <p>“<b>Denver</b>”: Sets the time zone to Denver time.</p> <p>“<b>Chicago</b>”: Sets the time zone to Chicago time.</p> <p>“<b>Anchorage</b>”: Sets the time zone to Anchorage time.</p> <p>“<b>Honolulu</b>”: Sets the time zone to Honolulu time.</p> <p>“<b>Phoenix</b>”: Sets the time zone to Phoenix time.</p> <p>The default is “<b>GMT</b>”, which uses UTC time exactly.</p>
------------------	---

---

---

## Usage Guidelines

Use this command to set the time zone for the local system clock.

To do this, you specify the amount by which your time zone is offset from UTC (coordinated universal time). The offset you specify is added to UTC to produce the local time.

Note that the router uses POSIX-style offsets. The POSIX specification uses positive signs west of Greenwich—not positive signs east of Greenwich, which many other systems use. For example, an offset of “**GMT +4**” corresponds to 4 hours behind UTC (that is, west of Greenwich).

## Chapter 3: Ethernet Interfaces, VLANs, and Bridging

This chapter lists the commands for configuring Ethernet interfaces, virtual interfaces (with optional VLAN tagging), the loopback interface, IP addresses, and bridging.

This chapter contains the following commands.

Command	Mode	Description
<code>interfaces</code>	Configuration	Sets configuration for interfaces.
<code>interfaces bridge</code>	Configuration	Defines a bridge group and its spanning tree parameters.
<code>interfaces ethernet</code>	Configuration	Defines an Ethernet interface and sets its characteristics.
<code>interfaces ethernet address</code>	Configuration	Defines an IP address on an Ethernet interface for non-802.1q packets.
<code>interfaces ethernet bridge-group</code>	Configuration	Assigns an interface to a bridge group.
<code>interfaces ethernet vif</code>	Configuration	Defines a virtual interface (vif) on an Ethernet interface for receiving 802.1q VLAN-tagged packets.
<code>interfaces ethernet vif address</code>	Configuration	Defines an IP address on a vif.
<code>interfaces ethernet vif bridge-group</code>	Configuration	Assigns a vif to a bridge group.
<code>interfaces loopback</code>	Configuration	Defines a loopback interface.
<code>interfaces loopback address</code>	Configuration	Defines an IP address on the loopback interface.
<code>show bridge</code>	Operational	Shows information for active bridge groups.
<code>show interfaces ethernet</code>	Operational	Displays information or statistics about Ethernet interfaces.

See also the following commands in other chapters.

<code>clear arp</code>	Operational	Clears the ARP cache. <i>See page 34.</i>
<code>show arp</code>	Operational	Displays the ARP cache. <i>See page 40.</i>
<code>show interfaces</code>	Operational	Displays information about interfaces. <i>See page 50.</i>

# interfaces

Sets configuration for interfaces.

---

## Command Mode

Configuration mode.

---

## Syntax

<code>set interfaces ...</code>	Creates the configuration node for a network interface and specifies whether to restore original configuration when the system is shut down.
<code>delete interfaces ...</code>	Deletes any user configuration for the <b>interfaces</b> configuration node, restoring factory defaults.

---

## Configuration Statement

```
interfaces {  
    restore: [true|false]  
}
```

---

## Parameters

---

<code>restore</code>	Indicates whether to restore configuration to factory defaults when the router is shut down. Supported values are as follows:  <b>true</b> : Restore original configuration when the router is shut down. <b>false</b> : Do not restore original configuration when the router is shut down.  The default is <b>false</b> .
----------------------	--

---

---

## Usage Guidelines

Use this command to specify configuration behavior on shutdown.

# interfaces bridge

Defines a bridge group and its spanning tree parameters.

---

## Command Mode

Configuration mode.

---

## Syntax

<code>set interfaces bridge ...</code>	Use <b>set</b> to create the <b>bridge</b> configuration node, which defines a bridge group to which interfaces and vifs may belong. You can also use <b>set</b> to overwrite bridge group properties.
<code>delete interfaces bridge ...</code>	Use <b>delete</b> to delete a <b>bridge</b> configuration node, which removes the specified bridge group.

---

## Configuration Statement

```
interfaces {  
  bridge br0..br9 {  
    description: text  
    disable: [true|false]  
    aging: 1-4294967296  
    stp: [true|false]  
    priority: 1-4294967296  
    forwarding-delay: 1-4294967296  
    hello-time: 1-4294967296  
    max-age: 1-4294967296  
  }  
}
```

---

## Parameters

<b>bridge</b>	Mandatory. The identifier for the bridge group. Supported identifiers are <b>br0</b> through <b>br09</b> .
<b>description</b>	Optional. A brief description for the bridge group.

---

<b>disable</b>	<p>Optional. Enables or disables bridging on this interface. Supported values are as follows:</p> <p><b>true</b>—Disables bridging on this interface, without discarding the configuration.</p> <p><b>false</b>—Enables bridging on this interface.</p> <p>The default is <b>false</b>.</p>
<b>aging</b>	<p>Optional. Sets the length of time in seconds a MAC address will be kept in this bridge's forwarding database before the entry is aged out of the table.</p> <p>The range is 1 to 4294967295. The default is 300.</p>
<b>stp</b>	<p>Optional. Allows you to enable or disable the Spanning Tree Protocol on a per-bridge basis. Supported values are as follows:</p> <p><b>true</b>: Enables Spanning Tree Protocol on this bridge.</p> <p><b>false</b>: Disables Spanning Tree Protocol on this bridge.</p> <p>The default is <b>false</b>.</p>
<b>priority</b>	<p>Optional. Sets the forwarding priority of this bridge in the spanning tree. The default is 0.</p>
<b>forwarding-delay</b>	<p>Optional. The amount of time in seconds this bridge will keep listening and learning about the topology of the spanning tree after a topology change. After the forward delay interval has passed, the bridge transitions to the Forwarding state.</p> <p>The range is 1 to 4294967295. The default is 0.</p>
<b>hello-time</b>	<p>Optional. The interval in seconds at which this bridge will transmit "hello packets," which are messages that communicate the state of the spanning tree topology. On a spanning tree, hello packets are sent by the bridge that assumes itself to be the root bridge.</p> <p>The range is 1 to 4294967295. The default is 0.</p>
<b>max-age</b>	<p>Optional. The interval a bridge will wait to receive a hello packets before removing a neighboring bridge.</p> <p>The range is 1 to 4294967295. The default is 0.</p>

---

---

## Usage Guidelines

Use this command to define a bridge and configure its bridging and Spanning Tree Protocol characteristics.

Note that you must create the bridge group (using this command) before you can assign interfaces to it.

# interfaces ethernet

Defines an Ethernet interface and sets its characteristics.

---

## Command Mode

Configuration mode.

---

## Syntax

<code>set interfaces ethernet ...</code>	Creates the configuration node for an Ethernet interface, or modifies configuration for the interface.
<code>delete interfaces ethernet ...</code>	Deletes all configuration for the specified Ethernet interface.

---

## Configuration Statement

```
interfaces {
  ethernet: eth0..eth23 {
    disable: [true|false]
    discard: [true|false]
    description: text
    mac: mac-addr
    mtu: 68-65535
    duplex: [full|half|auto]
    speed: [10|100|1000|auto]
  }
}
```

---

## Parameters

<b>ethernet</b>	<p>Multi-node. An identifier for the Ethernet interface you are defining. This may be <b>eth0</b> to <b>eth23</b>, depending on what Ethernet interfaces that actually available on the system.</p> <p>You can create as many <b>ethernet</b> configuration nodes as there are Ethernet interfaces available on your system. To see the interfaces available to the system kernel, use the <b>system</b> option of the <b>show interfaces</b> command (see page 50).</p>
-----------------	--

---

<b>disable</b>	<p>Optional. Enables or disables forwarding on this interface. Supported values are as follows:</p> <p><b>true</b>—Disables forwarding on this interface, without discarding the configuration.</p> <p><b>false</b>—Enables forwarding on this interface.</p> <p>The default is <b>false</b>.</p>
<b>discard</b>	<p>Optional. Specifies this interface as a discard interface. A discard interface is an interface that discards packets. You can configure local policies such that if a device comes under attack the attacking policies are forwarded out the discard interface. If desired, you can attach an output filter to the discard interface to log or count the packets as they egress. Otherwise, traffic is silently discarded.</p> <p>You can configure one discard interface per router. Supported values are as follows:</p> <p><b>true</b>: This interface is the discard interface.</p> <p><b>false</b>: This interface is not the discard interface.</p> <p>The default is <b>false</b>.</p>
<b>description</b>	<p>Optional. A mnemonic name or description for the interface. The default is an empty string.</p>
<b>mac</b>	<p>Optional. Sets the MAC address for the interface. MAC addresses on devices such as Ethernet devices are usually fixed, but in some cases it is possible to override the built-in default MAC address. The format should be appropriate for the interface type. For an Ethernet interface, this is six colon-separated 8-bit numbers in hexadecimal, for example:</p> <pre>00:0a:59:9a:f2:ba</pre>
<b>mtu</b>	<p>Optional. Sets the maximum transfer unit (MTU), in octets, for the interface as a whole. This will apply to all vifs defined for the interface.</p> <p>When forwarding, IPv4 packets larger than the MTU will be fragmented unless the DF bit is set. In that case, the packets will be dropped and an ICMP “Packet too big” message is returned to the sender.</p> <p>The range is 8 to 8818. If not set, fragmentation will never be performed.</p>

---

<b>duplex</b>	<p>Optional. Sets the duplexity of the interface. Supported values are as follows:</p> <p><b>full</b>: This interface is to be full duplex.</p> <p><b>half</b>: This interface is to be half duplex.</p> <p><b>auto</b>: The router will autonegotiate the duplexity of the interface.</p> <p>The default is <b>auto</b>.</p>
<b>speed</b>	<p>Optional. Sets the speed of the interface. Supported values are as follows:</p> <p><b>10</b>: 10 Mbps</p> <p><b>100</b>: 100 Mbps</p> <p><b>1000</b>: 1000 Mbps</p> <p><b>auto</b>: The router will autonegotiate the speed of the interface.</p> <p>The default is <b>auto</b>.</p>

---

---

## Usage Guidelines

Use this command to set the characteristics of Ethernet interfaces.

When the router starts up, it automatically discovers the physical interfaces available on the system and creates a loopback interface. Apart from the interfaces automatically created by the system, each level of interface, IP address, and vifs to be used must be explicitly created through configuration.

# interfaces ethernet address

Defines an IP address on an Ethernet interface for non-802.1q packets.

---

## Command Mode

Configuration mode.

---

## Syntax

<pre>set interfaces ethernet <i>name</i>   address ...</pre>	<p>Creates the configuration node for an IP address on an Ethernet interface, or modifies IP address configuration.</p> <p>Note that you cannot use <b>set</b> to change the address itself, as it is the identifier of a configuration node. To change an address delete the address and recreate it with the correct information.</p>
<pre>delete interfaces ethernet   <i>name</i> address ...</pre>	<p>Deletes all configuration for the specified address.</p>

---

## Configuration Statement

```
interfaces {
  ethernet [eth0..eth23] {
    address: [ipv4 | ipv6]{
      prefix-length: [0-32|0-128]
      broadcast: ipv4
      multicast-capable: [true|false]
      disable: [true|false]
    }
  }
}
```

---

## Parameters

<b>ethernet</b>	The Ethernet interface you are configuring: one of <b>eth0</b> through <b>eth23</b> . The interface must already have been defined.
<b>address</b>	Multi-node. Defines an IPv4 or IPv6 address on this interface.  You can define multiple IP addresses for a single interface, by creating multiple <b>address</b> configuration nodes.

---

<b>prefix-length</b>	<p>Mandatory. Specifies the prefix length of the subnet connected to this interface.</p> <ul style="list-style-type: none"><li>• For IPv4 addresses, the range is 0 to 32.</li><li>• For IPv6 addresses, the range is 0 to 128.</li></ul>
<b>broadcast</b>	<p>Gives the subnet broadcast address for the subnet corresponding to this address.</p> <p>Configuring this value is optional, as the system automatically calculates the broadcast address. You can use this option to override the automatically calculated broadcast address.</p> <ul style="list-style-type: none"><li>• The broadcast address for IPv4 addresses must be an IPv4 address.</li><li>• The broadcast address for IPv6 addresses must be an IPv6 address.</li></ul>
<b>disable</b>	<p>Enables or disables this IP address for routing and forwarding. Supported values are as follows:</p> <p><b>true</b>—Disables this IP address, without discarding the configuration.</p> <p><b>false</b>—Enables this IP address.</p> <p>The default is <b>false</b>.</p>

---

---

## Usage Guidelines

Use this command to define an IP address on an interface.

If you are not using 802.1q and you want to have multiple networks on the same physical interface, Use this command to define multiple IP addresses for the interface.

# interfaces ethernet bridge-group

Assigns an interface to a bridge group.

---

## Command Mode

Configuration mode.

---

## Syntax

<code>set interfaces ethernet <i>name</i> bridge-group ...</code>	Creates the <b>bridge-group</b> configuration node for an interface, or Modifies existing bridge group settings for an interface.
<code>delete interfaces ethernet <i>name</i> bridge-group ...</code>	Deletes bridge group configuration for an interface.

---

## Configuration Statement

```
interfaces {  
  ethernet [eth0..eth23]  
    bridge-group {  
      bridge: br0..br9  
      cost: 1-4294967296  
      priority: 1-4294967296  
    }  
  }  
}
```

---

## Parameters

<b>ethernet</b>	The Ethernet interface you are configuring: one of <b>eth0</b> through <b>eth23</b> . The interface must already have been defined.
<b>bridge-group</b>	Assigns this network interface to the specified bridge group: the identifier will be <b>br0</b> through <b>br9</b> . The bridge group must already exist. To define a bridge group, use the <b>the interfaces bridge</b> command (see page 80).  Note that membership in a Layer 2 bridge group precludes configuring IP settings (a Layer 3 protocol) for an interface.
<b>cost</b>	Optional. Specifies the path cost of this interface. An integer from 0 to 65535, where a higher number indicates a higher cost. The default is 0.

---

<b>priority</b>	Optional. Sets the order in which ports of equal cost are used. The default is 0.
-----------------	---

---

---

### Usage Guidelines

Use this command to assign an interface to a bridge and set its cost and priority within the group.

Note that you must already have created the bridge group using the **interfaces bridge** command (see page 80).

## interfaces ethernet vif

Defines a virtual interface (vif) on an Ethernet interface for receiving 802.1q VLAN-tagged packets.

---

### Command Mode

Configuration mode.

---

### Syntax

```
set interfaces ethernet  
  name vif vlan-id ...
```

Creates the configuration node for a vif, or modifies vif configuration.

A vif on an Ethernet interface is always a VLAN interface, and the identifier of the vif of an Ethernet interface is its VLAN ID.

Note that you cannot use **set** to change the VLAN ID for a vif, as it is the identifier of a configuration node. To change this information delete the vif and recreate it with the correct VLAN ID.

```
delete interfaces ethernet  
  name vif vlan-id ...
```

Deletes all configuration for the specified vif.

---

### Configuration Statement

```
interfaces {  
  ethernet [eth0..eth23] {  
    vif 1-4096 {  
      disable:[true|false]  
    }  
  }  
}
```

---

### Parameters

---

<b>ethernet</b>	The Ethernet interface you are configuring: one of <b>eth0</b> through <b>eth23</b> . The interface must already have been defined.
-----------------	---

---

---

<b>vif</b>	<p>Multi-node. The VLAN ID for the vif, for use with 802.1q VLAN tagging. Only tagged packets are received on vifs configured on Ethernet interfaces.</p> <p>The range is 1 to 4096.</p> <p>You can define more than one vif for a single interface by creating multiple <b>vif</b> configuration nodes.</p>
<b>disable</b>	<p>Optional. Enables or disables this vif. Supported values are as follows:</p> <p><b>true</b>—Disables this vif, without discarding the configuration.</p> <p><b>false</b>—Enables this vif.</p> <p>The default is <b>false</b>.</p>

---

## Usage Guidelines

Use this command to define a virtual interface (vif) on an interface, or to enable or disable a vif.

In the Vyatta OFR router, most configuration can be applied either directly to the physical interface, or to a *virtual interface* (vif), which is a logical interface created for the physical interface. When the router starts up, it automatically detects the physical interfaces available on your device and creates configuration nodes for them. For example, on a system with two Ethernet interfaces, the router automatically creates configuration nodes for **eth0** and **eth1**.

Ethernet vifs are used only when 802.1Q VLANs are to be supported. In a basic Ethernet configuration, such as that for trial or evaluation or for a simple network topology, it will often be simplest and adequate to apply IP addresses directly to the physical interface.

Each physical interface can have multiple IP addresses assigned to it. If you want to have multiple networks on the same physical interface (that is, if you want to use multinetting, but not VLANs), simply create multiple **address** configuration nodes directly under the primary interface.

Note that, in statements other than **interface** statements, the notation for referring to a vif is *int.vif*—for example, **eth1.40**. When referring to a vif within an interface statement (**set interface**, **delete interface**, and **show interface** in configuration mode) the notation is **interface int vif vif**—for example, **set interface eth1 vif 40**.

# interfaces ethernet vif address

Defines an IP address on a vif.

---

## Command Mode

Configuration mode.

---

## Syntax

`set interfaces ethernet int.vif address ...` Creates the configuration node for an IP address on an Ethernet vif, or modifies address configuration.

Note that you cannot use **set** to change the address itself, as it is the identifier of a configuration node. To change an address, delete it and recreate it with the correct information.

`delete interfaces ethernet int.vif address ...` Deletes all configuration for the specified address.

---

## Configuration Statement

```
interfaces {
  ethernet [eth0..eth23] {
    vif: 1-4096 {
      address: [ipv4 | ipv6]{
        prefix-length: [0-32|0-128]
        broadcast: ipv4
        multicast-capable: [true|false]
        disable: [true|false]
      }
    }
  }
}
```

---

## Parameters

<b>ethernet</b>	The Ethernet interface you are configuring: one of <b>eth0</b> through <b>eth23</b> . The interface must already have been defined.
<b>vif</b>	The identifier (VLAN ID) of the Ethernet vif you are configuring. The vif must already have been defined.
<b>address</b>	Multi-node. Defines an IPv4 or IPv6 address on this vif.  You can define multiple IP addresses for a single vif, by creating multiple <b>address</b> configuration nodes beneath the vif.
<b>prefix-length</b>	Mandatory. Specifies the prefix length of the subnet connected to this vif. <ul style="list-style-type: none"> <li>For IPv4 addresses, the range is 0 to 32.</li> <li>For IPv6 addresses, the range is 0 to 128.</li> </ul>
<b>broadcast</b>	Gives the subnet broadcast address for the subnet corresponding to this address.  Configuring this value is optional, as the system automatically calculates the broadcast address. You can use this option to override the automatically calculated broadcast address. <ul style="list-style-type: none"> <li>The broadcast address for IPv4 addresses must be an IPv4 address.</li> <li>The broadcast address for IPv6 addresses must be an IPv6 address.</li> </ul>
<b>disable</b>	Enables or disables this IP address for routing and forwarding. Supported values are as follows:  <b>true</b> —Disables this IP address, without discarding the configuration. <b>false</b> —Enables this IP address.  The default is <b>false</b> .

---

## Usage Guidelines

Use this command to define an IP address on a vif.

# interfaces ethernet vif bridge-group

Assigns a vif to a bridge group.

## Command Mode

Configuration mode.

## Syntax

<code>set interfaces ethernet <i>int.vif</i> bridge-group ...</code>	Creates the <b>bridge-group</b> configuration node for a vif, or modifies existing bridge group settings for a vif.
<code>delete interfaces ethernet <i>int.vif</i> bridge-group ...</code>	Deletes bridge group configuration for a vif.

## Configuration Statement

```
interfaces {  
  ethernet [eth0..eth0]  
    vif 1-4096  
      bridge-group {  
        bridge: br0..br9  
        cost: 1-4294967296  
        priority: 1-4294967296  
      }  
    }  
}
```

## Parameters

<b>ethernet</b>	The Ethernet interface you are configuring: one of <b>eth0</b> through <b>eth23</b> . The interface must already have been defined.
<b>vif</b>	The identifier (VLAN ID) of the Ethernet vif you are configuring. The vif must already have been defined.
<b>bridge-group</b>	Assigns this vif to the specified bridge group: the identifier will be <b>br0</b> through <b>br9</b> . The bridge group must already exist. To define a bridge group, use the <b>interfaces bridge</b> command (see page 80).  Note that membership in a Layer 2 bridge group precludes configuring IP settings (a Layer 3 protocol) for vif.

---

<b>cost</b>	Optional. Specifies the path cost of this vif. An integer from 0 to 65535, where a higher number indicates a higher cost. The default is 0.
<b>priority</b>	Optional. Sets the order in which ports of equal cost are used. The default is 0.

---

---

## Usage Guidelines

Use this command to assign a vif to a bridge and set its cost and priority within the group.

Note that you must already have created the bridge group using the **interfaces bridge** command (see page 80).

# interfaces loopback

Defines a loopback interface.

---

## Command Mode

Configuration mode.

---

## Syntax

`set interfaces loopback lo ...` Creates the configuration node for the loopback interface, or modifies loopback interface information.

`delete interfaces loopback lo ...` Deletes the loopback interface.

---

## Configuration Statement

```
interfaces {  
    loopback: lo {  
        description: text  
    }  
}
```

---

## Parameters

<b>loopback</b>	The identifier of the loopback interface: this is always <b>lo</b> .
<b>description</b>	A brief description for the interface.

---

## Usage Guidelines

Use this command to define the loopback interface.

The loopback interface is a special software-only interface that emulates a physical interface and allows the router to “connect” to itself. Packets routed to the loopback interface are rerouted back to the router and processed locally. Packets routed out the loopback interface but not destined for the loopback interface are dropped.

The loopback interface provides a number of advantages:

- As long as the router is functioning, the loopback interface is always up, and so is very reliable. As long as there is even one functioning link to the router, the loopback interface can be accessed. The loopback interface thus eliminates the need to try each IP address of the router until you find one that is still up.
- Because the loopback interface is always up, a routing session (such as a BGP session) can continue even if the outbound interface fails.
- You can simplify collection of management information by specifying the loopback interface as the interface for sending and receiving management information such as logs and SNMP traps.
- The loopback interface can be used as to increase security, by filtering incoming traffic using access control rules that specify the local interface as the only acceptable destination.
- In OSPF, you can advertise a loopback interface as an interface route into the network, regardless of whether physical links are up or down. This increases reliability, since the the routing traffic is more likely to be received and subsequently forwarded.
- In BGP, parallel paths can be configured to the loopback interface on a peer device. This provides improved load sharing.

# interfaces loopback address

Defines an IP address on the loopback interface.

---

## Command Mode

Configuration mode.

---

## Syntax

```
set interfaces loopback  
  lo address ...
```

Creates an IP address for the loopback interface, or modifies loopback interface address information.

Note that you cannot use **set** to change the address itself, as it is the identifier of a configuration node. To change an address, delete it and recreate it with the correct information.

```
delete interfaces loopback  
  lo address ...
```

Deletes this address on the loopback interface.

---

## Configuration Statement

```
interfaces {  
  loopback: lo {  
    address: [ipv4|ipv6]{  
      prefix-length: [0-32|0-128]  
      broadcast: ipv4  
      multicast-capable: [true|false]  
      disable: [true|false]  
    }  
  }  
}
```

---

## Parameters

<b>loopback</b>	The identifier of the loopback interface: this is always <b>lo</b> .
<b>address</b>	<p>Multi-node. Defines an IPv4 or IPv6 address on the loopback interface.</p> <p>You can define multiple IP addresses for the loopback interface, by creating multiple <b>address</b> configuration nodes.</p>
<b>prefix-length</b>	<p>Mandatory. Specifies the prefix length of the subnet connected to this vif.</p> <ul style="list-style-type: none"><li>• For IPv4 addresses, the range is 0 to 32.</li><li>• For IPv6 addresses, the range is 0 to 128.</li></ul>
<b>broadcast</b>	<p>Gives the subnet broadcast address for the subnet corresponding to this address.</p> <p>Configuring this value is optional, as the system automatically calculates the broadcast address. You can use this option to override the automatically calculated broadcast address.</p> <ul style="list-style-type: none"><li>• The broadcast address for IPv4 addresses must be an IPv4 address.</li><li>• The broadcast address for IPv6 addresses must be an IPv6 address.</li></ul>
<b>disable</b>	<p>Enables or disables this IP address for routing and forwarding. Supported values are as follows:</p> <p><b>true</b>—Disables this IP address, without discarding the configuration.</p> <p><b>false</b>—Enables this IP address.</p> <p>The default is <b>false</b>.</p>

---

## Usage Guidelines

Use this command to define an IP address for the loopback interface.

The router automatically creates the loopback interface on startup, with an interface name of **lo**. You must configure an IP address for the interface. The IP address for the loopback interface must be unique, and must not be used by any other interface.

When configuring the router, it is good practice to take advantage of the loopback interface's reliability:

- The router's hostname should be mapped to the loopback interface address, rather than a physical interface.
- In OSPF and BGP, the router ID should be set to the loopback address.
- The network for the loopback interface can be small, since IP address space is not a consideration in this case. Often a prefix of /32 is assigned.

**NOTE** *In some systems, the IP address 127.0.0.0 is assigned to the loopback interface by convention. However, in the Vyatta OFR the network 127.0.0.0/8 is reserved for XORP to communicate between processes. As a result, no IP address on this reserved network may be configured on any interface. Any other network may be assigned to the loopback interface.*

# show bridge

Shows information for active bridge groups.

---

## Command Mode

Operational mode.

---

## Syntax

```
show bridge [bridge-group [macs | spanning-tree]]
```

---

## Parameters

<i>bridge-group</i>	Displays information for the specified bridge group: one of <b>eth0</b> through <b>eth23</b> .
<b>macs</b>	Shows the MAC table for the specified bridge.
<b>spanning-tree</b>	Shows spanning tree information for the specified bridge.

---

## Usage Guidelines

Use this command to display information about configured bridge groups.

When used with no option, this command displays information about all active bridge groups. When the identifier of a bridge group is provided, this command displays information for the specified bridge group. You can display the MAC table and Spanning Tree Protocol information for a bridge group.

# show interfaces ethernet

Displays information or statistics about Ethernet interfaces.

---

## Command Mode

Operational mode.

---

## Syntax

```
show interfaces ethernet [eth0..eth23 [physical | vif vlan-id]]
```

---

## Parameters

<b>ethernet</b>	Displays information for only Ethernet interfaces.
<i>interface</i>	Displays information for the specified Ethernet interface.
<b>physical</b>	Displays physical layer settings for the specified Ethernet interface.

---

## Usage Guidelines

Use this command to view command and operational status of interfaces and vifs.

- When used with no argument, the **ethernet** option shows information for all Ethernet interfaces.
- When an interface name is supplied, the **ethernet** option shows information about the specified Ethernet interface only.
- When the **physical** argument is used, the **ethernet** option shows physical layer settings for the specified Ethernet interface.

---

## Examples

Example 3-1 shows the first screen of output for **show interfaces ethernet**.

Example 3-1 “show interfaces ethernet”: Displaying Ethernet interface information

---

```
vyatta@vyatta> show interfaces ethernet
eth0: <NO-CARRIER,BROADCAST,MULTICAST,UP> mtu 1500 qdisc
pfifo_fast qlen 1000
    link/ether 00:18:fe:fa:16:18 brd ff:ff:ff:ff:ff:ff
    RX: bytes  packets  errors  dropped overrun mcast
         0         0         0         0         0         0
    TX: bytes  packets  errors  dropped carrier collsns
         0         0         0         0         0         0
eth1: <BROADCAST,MULTICAST,UP,10000> mtu 1500 qdisc pfifo_fast
qlen 1000
    link/ether 00:18:fe:fa:16:19 brd ff:ff:ff:ff:ff:ff
    inet 10.1.0.40/24 brd 10.1.0.255 scope global eth1
    inet6 fe80::218:feff:fefa:1619/64 scope link
        valid_lft forever preferred_lft forever
    RX: bytes  packets  errors  dropped overrun mcast
    641361      8860      0         0         0        21
    TX: bytes  packets  errors  dropped carrier collsns
    406342      3355      0         0         0         0
```

---

Example 3-2 shows the first screen of output for **show interfaces ethernet ethx physical**.

Example 3-2 “show interfaces ethernet ethX physical”: Displaying physical line characteristics for Ethernet interfaces

---

```
vyatta@vyatta> show interfaces ethernet eth0 physical
Settings for eth0:
    Supported ports: [ MII ]
    Supported link modes:   10baseT/Half 10baseT/Full
                           100baseT/Half 100baseT/Full
                           1000baseT/Half 1000baseT/Full
    Supports auto-negotiation: Yes
    Advertised link modes:  10baseT/Half 10baseT/Full
                           100baseT/Half 100baseT/Full
                           1000baseT/Half 1000baseT/Full
    Advertised auto-negotiation: Yes
    Speed: Unknown! (65535)
    Duplex: Unknown! (255)
    Port: Twisted Pair
```

---

```
PHYAD: 1
Transceiver: internal
Auto-negotiation: on
Supports Wake-on: g
Wake-on: d
Current message level: 0x000000ff (255)
Link detected: no
vyatta@vyatta>
```

---

## Chapter 4: Serial Interfaces

This chapter lists the commands for configuring serial interfaces.

This chapter contains the following commands.

Command	Mode	Description
<code>clear interfaces serial</code>	Operational	Clears counters for serial interfaces
<code>interfaces serial</code>	Configuration	Specifies basic serial interface configuration, including Layer 2 encapsulation characteristics.
<code>interfaces serial cisco-hdlc</code>	Configuration	Defines the characteristics of Cisco High-Level Data Link Control encapsulation on a serial interface.
<code>interfaces serial e1-options</code>	Configuration	Specifies the physical line characteristics for E1 serial interfaces.
<code>interfaces serial frame-relay</code>	Configuration	Defines the characteristics of Frame Relay encapsulation on an interface.
<code>interfaces serial ppp</code>	Configuration	Defines the characteristics of Point-to-Point Protocol encapsulation on an interface.
<code>interfaces serial t1-options</code>	Configuration	Specifies the physical line characteristics for T1 serial interfaces.
<code>interfaces serial t3-options</code>	Configuration	Specifies the physical line characteristics for T3 serial interfaces.
<code>show interfaces serial</code>	Operational	Displays information about a specific serial interface.

See also the following commands in other chapters.

<code>show interfaces</code>	Operational	Displays information about interfaces. See page 50.
<code>interfaces serial cisco-hdlc vif firewall</code>	Operational	Applies named firewall instances (packet-filtering rule sets) to a Cisco HDLC-encapsulated serial interface. See page 338.
<code>interfaces serial frame-relay vif firewall</code>	Operational	Applies named firewall instances (packet-filtering rule sets) to a Frame Relay-encapsulated serial interface. See page 341.
<code>interfaces serial ppp vif firewall</code>	Operational	Applies named firewall instances (packet-filtering rule sets) to a Point-to-Point Protocol-encapsulated serial interface. See page 344.

# clear interfaces serial

Clears counters for serial interfaces

---

## Command Mode

Operational mode.

---

## Syntax

```
clear interfaces serial interface counters {all | physical |  
cisco-hdlc | frame-relay | ppp}
```

---

## Parameters

<i>interface</i>	The identifier of a configured serial interface.
<b>all</b>	Clears all counters for the specified serial interface.
<b>physical</b>	Clears counters related to the physical line settings for the specified interface.
<b>cisco-hdlc</b>	Clears counters related to Cisco HDLC settings for the specified interface.
<b>frame-relay</b>	Clears counters related to Frame Relay settings for the specified interface.
<b>ppp</b>	Clears counters related to Point-to-Point Protocol settings for the specified interface.

---

## Usage Guidelines

Use this command to clear statistics for a specified serial interface.

At least one of the filters must be specified.

# interfaces serial

Specifies basic serial interface configuration, including Layer 2 encapsulation characteristics.

---

## Command Mode

Configuration mode.

---

## Syntax

`set interfaces serial name ...` Use **set** to create the configuration node for a serial interface, or to modify serial interface configuration.

You can define multiple serial interfaces by creating multiple **serial** configuration nodes.

Note that you cannot use **set** to change the name of the serial interface. To change the name of a serial interface, you must **delete** the old **serial** configuration node and create a new one.

`delete interfaces serial name ...` Use **delete** to delete configuration for a serial interface.

---

## Configuration Statement

```
interfaces {  
  serial [wan0..wan23] {  
    encapsulation: [ppp|cisco-hdlc|frame-relay]  
    description: text  
  }  
}
```

---

## Parameters

---

<b>encapsulation</b>	Mandatory. The encapsulation type of the interface. Supported values are as follows:  <b>ppp</b> : Uses Point-to-Point Protocol (PPP) encapsulation on the interface.  <b>cisco-hdlc</b> : Uses Cisco High-Level Data Link Control (Cisco HDLC) encapsulation on the interface.  <b>frame-relay</b> : Uses Frame Relay encapsulation on the interface.
----------------------	--

---

---

<b>description</b>	Optional. A brief description for the serial interface.  By default, the system auto-detects the card type and indicates it in the description.
--------------------	---

---

---

### Usage Guidelines

Use this command to specify the encapsulation type and physical line characteristics of traffic that will pass through this serial interface.

## interfaces serial cisco-hdlc

Defines the characteristics of Cisco High-Level Data Link Control encapsulation on a serial interface.

---

### Command Mode

Configuration mode.

---

### Syntax

`set interfaces serial name  
cisco-hdlc ...`

Use **set** to create the **cisco-hdlc** configuration node, or to modify Cisco HDLC encapsulation.

Note that you cannot use **set** to change the identifier of configuration nodes. To change the identifier of a configuration node, you must **delete** the old configuration node and create a new one with the correct identifier.

`delete interfaces serial  
name cisco-hdlc ...`

Use **delete** to delete configuration for Cisco HDLC encapsulation on this interface.

---

### Configuration Statement

```
interfaces {  
  serial [wan0..wan23] {  
    cisco-hdlc {  
      keepalives {  
        require-rx: [enable|disable]  
        timer: 10-60000  
      }  
      vif 1 {  
        address {  
          local-address: ipv4  
          prefix-length: 0-32  
          remote-address: ipv4  
        }  
        description: text  
      }  
    }  
  }  
}
```

---

## Parameters

<b>keepalives</b>	<p>Sets the value for the keep-alive timeout.</p> <p>If the <b>rxinterval</b> timer expires without receiving a keep-alive message from the peer interface, the interface increments the <b>down-count</b> counter. If the <b>down-count</b> timer reaches the configured limit, the peer interface is declared down.</p> <p>All interfaces using the HDLC keep-alive mechanism must be configured with corresponding timers; that is, the <b>rxinterval</b> of the one peer must match the <b>txinterval</b> of the other.</p>
<b>require-rx</b>	<p>Require keep-alive messages for a link to be considered up. Supported values are as follows:</p> <p><b>enable</b>: Require keep-alive messages. If keep-alive messages are not received, the peer interface is declared down.</p> <p><b>disable</b>: Do not require keep-alive messages.</p> <p>The default is <b>disable</b>.</p>
<b>timer</b>	<p>The interval for keep-alive messages, in seconds. The range is 10 to 60000. The default is 10.</p>
<b>vif</b>	<p>The identifier of the virtual interface. Currently, only one vif is supported for Cisco HDLC interfaces, and the identifier must be <b>1</b>.</p>
<b>address</b>	<p>IP address information. Each serial vif can support exactly one IP address.</p>
<b>local-address</b>	<p>Mandatory. The IPv4 address for this vif.</p>
<b>prefix-length</b>	<p>Mandatory. The prefix defining the network served by this interface. The range is 0 to 32.</p>
<b>remote-address</b>	<p>Mandatory. An IPv4 address representing the network address.</p>
<b>description</b>	<p>Optional. A brief description for the interface. If the description contains spaces, it must be enclosed in double quotes.</p>

---

## Usage Guidelines

Use this command to define the Cisco High-Level Data Link Control characteristics of the line.

Note that on Cisco HDLC interfaces, IP addresses are assigned to virtual interfaces, not directly to the interface. Currently, only one vif is supported, but multiple addresses may be defined for the vif.

The full identifier of an HDLC interface is *int* **cisco-hdlc vif** *vif*. For example, the full identifier of the HDLC vif on wan1 is **wan1 cisco-hdlc vif 1**. Note that subsequent to initial definition, the notation for referring to this is *int.vif*—that is, **wan1.1**.

## interfaces serial e1-options

Specifies the physical line characteristics for E1 serial interfaces.

---

### Command Mode

Configuration mode.

---

### Syntax

<code>set interfaces serial <i>name</i> e1-options...</code>	Use <b>set</b> to configure physical line characteristics for an E1 serial interface, or to modify E1 serial interface configuration.
<code>delete interfaces serial <i>name</i> e1-options...</code>	Use <b>delete</b> to delete configuration for an E1 serial interface.

---

### Configuration Statement

```
interfaces {  
  serial [wan0..wan23] {  
    e1-options {  
      framing: [g704|g704-no-crc4|unframed]  
      timeslots {  
        start: [1-32]  
        stop: [1-32]  
      }  
      mtu: 8-8188  
      clock: [internal|external]  
    }  
  }  
}
```

---

### Parameters

<b>framing</b>	Optional. Sets the frame type for the interface. Supported values are as follows:  <b>g704</b> : Sets the E1 frame type to use CRC4. <b>g704-no-crc</b> : Sets the E1 frame type not to use CRC4. <b>unframed</b> : Configures full-rate (2048 kbps) unchannelized E1 bandwidth for the line.  The default is <b>g704</b> .
----------------	---

---

<b>timeslots</b>	Optional. Allows you to configure a fraction of a 32-port channelized E1 line. To do this, you assign a range of timeslots to the line.
<b>start</b>	The first timeslot in the range. The range of values is 1 to 32, where the value of <b>start</b> must be less than the value of <b>stop</b> . The default is 1.
<b>stop</b>	The last timeslot in the range. The range of values is 1 to 32, where the value of <b>start</b> must be less than the value of <b>stop</b> . The default is 32.
<b>mtu</b>	<p>Optional. Sets the maximum transfer unit (MTU), in octets, for the interface as a whole. This will apply to all vifs defined for the interface.</p> <p>When forwarding, IPv4 packets larger than the MTU will be fragmented unless the DF bit is set. In that case, the packets will be dropped and an ICMP “Packet too big” message is returned to the sender.</p> <p>The range is 8 to 8188. If not set, fragmentation will never be performed. The default is 1500.</p>
<b>clock</b>	<p>Optional. Sets the timing source for the circuit. Supported values are as follows:</p> <p><b>internal</b>: The interface will use the internal clock.</p> <p><b>external</b>: The interface will use the external DTE TX and RX clock.</p> <p>The default is <b>external</b>.</p>

## Usage Guidelines

Use this command to specify the physical line characteristics of traffic that will pass through this E1 serial interface.

Configuring this option designates this interface as an E1 interface for transmitting signals in European digital transmission (E1) format. The E1 signal format carries information at a rate of 2.048 Mbps and can carry 32 channels of 64 Kbps each.

Currently, only high-density bipolar of order 3 (hdb3) line encoding is supported.

# interfaces serial frame-relay

Defines the characteristics of Frame Relay encapsulation on an interface.

---

## Command Mode

Configuration mode.

---

## Syntax

```
set interfaces serial name
    frame-relay ...
```

Use **set** to create the **frame-relay** configuration node, or to modify configuration for Frame Relay encapsulation.

Note that you cannot use **set** to change the identifier of configuration nodes. To change the identifier of a configuration node, you must **delete** the old configuration node and create a new one with the correct identifier.

```
delete interfaces serial
    name frame-relay ...
```

Use **delete** to delete configuration for Frame Relay encapsulation on this interface.

---

## Configuration Statement

```
interfaces {
  serial [wan0..wan23] {
    frame-relay {
      signaling: [auto|ansi|q933|lmi]
      signaling-options {
        n391dte: 1-255
        n392dte: 1-100
        n393dte: 1-10
        t391dte: 5-30
      }
      vif [16..991] {
        address {
          local-address: ipv4
          prefix-length: 0-32
          remote-address: ipv4
        }
        description: text
      }
    }
  }
}
```

---

## Parameters

<b>signaling</b>	<p>Specifies the Frame Relay signaling variant (LMI type). Supported values are as follows:</p> <p><b>auto</b>: Autonegotiates the LMI type.</p> <p><b>ansi</b>: Uses ANSI-617d Annex D LMI type.</p> <p><b>q933</b>: Uses the Q.933 (ITU-T (CCIT) Q.933 annex A) LMI type.</p> <p><b>lmi</b>: Uses Cisco proprietary LMI type.</p> <p>The default is auto.</p>
<b>signaling-options</b>	Sets the Frame Relay signaling options.
<b>n391dte</b>	<p>Sets the DTE full status message polling interval, which is the interval, in seconds, at which this interface expects a full status report from the DCE interface. All other status enquiries can be responded to with a keep-alive exchange only. The range is 1 to 255. The default is 6.</p>
<b>n392dte</b>	<p>Sets the DTE error threshold, which is the number of errors which, if they occur within the event count specified by the <b>n393dte</b> attribute, will cause the link to be declared down.</p> <p>The range is 1 to 100. The default is 6.</p>
<b>n393dte</b>	<p>Sets the DTE monitored event count. The range is 1 to 10. The default is 4.</p>
<b>t391dte</b>	<p>Sets the DTE keep-alive timer. This is the interval, in seconds, at which the interface sends out a keep-alive request to the DCE interface, which should respond with a keep-alive message. At the interval defined by the n391dte option, the DCE will send a full status report instead of just a keep-alive message.</p> <p>The range is 5 to 30. The default is 10.</p>
<b>vif</b>	<p>The identifier of the virtual interface. For Frame Relay interfaces, this is the DLCI number for the interface. The range is 16 to 991.</p>
<b>address</b>	<p>IP address information. Each serial vif can support exactly one IP address.</p>
<b>local-address</b>	<p>Mandatory. The IPv4 address for this vif.</p>
<b>prefix-length</b>	<p>Mandatory. The prefix defining the network served by this interface. The range is 0 to 32.</p>

---

---

<b>remote-address</b>	Mandatory. An IPv4 address representing the network address.
<b>description</b>	Optional. A brief description for the interface. If the description contains spaces, it must be enclosed in double quotes.

---

---

## Usage Guidelines

Use this command to define Frame Relay settings on an interface. This consists primarily of defining the signaling variant, the PVC characteristics, and the keep-alive (health checking) characteristics of the line.

The full identifier of an Frame Relay interface is *int* **frame-relay vif** *vif*. For example, the full identifier of the Frame Relay vif 16 on wan0 is **wan0 frame-relay vif 16**. Note that subsequent to initial definition, the notation for referring to this is *int.vif*—that is, **wan0.16**.

# interfaces serial ppp

Defines the characteristics of Point-to-Point Protocol encapsulation on an interface.

---

## Command Mode

Configuration mode.

---

## Syntax

```
set interfaces serial name
  ppp ...
```

Use **set** to create the **ppp** configuration node, or to modify configuration for Point-to-Point Protocol encapsulation.

Note that you cannot use **set** to change the identifier of configuration nodes. To change the identifier of a configuration node, you must **delete** the old configuration node and create a new one with the correct identifier.

```
delete interfaces serial
  name ppp ...
```

Use **delete** to delete configuration for Point-to-Point Protocol encapsulation on this interface.

---

## Configuration Statement

```
interfaces {
  serial [wan0..wan23] {
    ppp {
      authentication {
        type: [none|chap|pap]
        user-id: text
        password: text
      }
      vif 1 {
        address {
          local-address: ipv4
          prefix-length: 0-32
          remote-address: ipv4
        }
        description: text
      }
    }
  }
}
```

## Parameters

<b>authentication</b>	Sets the authentication parameters for the interface.
<b>type</b>	<p>Sets the authentication type. Supported values are as follows:</p> <p><b>none:</b> Authentication is not required on this interface.</p> <p><b>chap:</b> Uses the Challenge Handshake Authentication Protocol (CHAP), as defined in RFC 1994.</p> <p><b>pap:</b> Uses the Password Authentication Protocol (PAP). The client authenticates itself by sending a user ID and a password to the server, which the server compares to the password in its internal database.</p>
<b>user-id</b>	Used with PAP. The user ID of the client.
<b>password</b>	Used with PAP. The password of the client.
<b>vif</b>	The identifier of the virtual interface. Currently, only one vif is supported for point-to-point interfaces, and the identifier must be <b>1</b> .
<b>address</b>	IP address information. Each serial vif can support exactly one IP address.
<b>local-address</b>	Mandatory. The IPv4 address for this vif.
<b>prefix-length</b>	Mandatory. The prefix defining the network served by this interface. The range is 0 to 32.
<b>remote-address</b>	Mandatory. An IPv4 address representing the network address.
<b>description</b>	Optional. A brief description for the interface. If the description contains spaces, it must be enclosed in double quotes.

## Usage Guidelines

Use this command to define Point-to-Point Protocol settings on an interface.

The full identifier of a Point-to-Point Protocol interface is *int* **ppp vif** *vif*. For example, the full identifier of the point-to-point vif on wan1 is **wan1 ppp vif 1**. Note that subsequent to initial definition, the notation for referring to this is *int.vif*—that is, **wan1.1**.

# interfaces serial t1-options

Specifies the physical line characteristics for T1 serial interfaces.

---

## Command Mode

Configuration mode.

---

## Syntax

<code>set interfaces serial <i>name</i> t1-options...</code>	Use <b>set</b> to configure physical line characteristics for a T1 serial interface, or to modify T1 serial interface configuration.
<code>delete interfaces serial <i>name</i> t1-options...</code>	Use <b>delete</b> to delete configuration for a T1 serial interface.

---

## Configuration Statement

```
interfaces {  
  serial [wan0..wan23] {  
    t1-options {  
      lbo: [0-110ft|110-220fr|220-330ft|330-440ft|440-550ft]  
      timeslots {  
        start: [1-24]  
        stop: [1-24]  
      }  
      mtu: 8-8188  
      clock: [internal|external]  
    }  
  }  
}
```

---

## Parameters

<b>lbo</b>	<p>Optional. Sets the maximum line build-out length. Supported values are as follows:</p> <p><b>0–110ft:</b> The line will not exceed 110 feet in length.</p> <p><b>110–220ft:</b> The line will be between 110 and 220 feet in length.</p> <p><b>220–330ft:</b> The line will be between 220 and 330 feet in length.</p> <p><b>330–440ft:</b> The line will be between 330 and 440 feet in length.</p> <p><b>440–550ft:</b> The line will be between 440 and 550 feet in length.</p> <p>The default is <b>0-110ft</b>.</p>
<b>timeslots</b>	<p>Optional. Allows you to configure a fraction of a 24-port channelized T1 line. To do this, you assign a range of timeslots to the line.</p>
<b>start</b>	<p>The first timeslot in the range. The range of values is 1 to 24, where the value of <b>start</b> must be less than the value of <b>stop</b>. The default is 1.</p>
<b>stop</b>	<p>The last timeslot in the range. The range of values is 1 to 24, where the value of <b>start</b> must be less than the value of <b>stop</b>. The default is 24.</p>
<b>mtu</b>	<p>Optional. Sets the maximum transfer unit (MTU), in octets, for the interface as a whole. This will apply to all vifs defined for the interface.</p> <p>When forwarding, IPv4 packets larger than the MTU will be fragmented unless the DF bit is set. In that case, the packets will be dropped and an ICMP “Packet too big” message is returned to the sender.</p> <p>The range is 8 to 8188. If not set, fragmentation will never be performed. The default is 1500.</p>
<b>clock</b>	<p>Optional. Sets the timing source for the circuit. Supported values are as follows:</p> <p><b>internal:</b> The interface will use the internal clock.</p> <p><b>external:</b> The interface will use the external DTE TX and RX clock.</p> <p>The default is <b>external</b>.</p>

---

---

## Usage Guidelines

Use this command to specify the physical line characteristics of traffic that will pass through this T1 serial interface.

Configuring this option designates this interface as a T1 interface for transmitting digital signals in the T-carrier system used in the United States, Japan, and Canada. The T1 signal format carries 24 pulse code modulation (PCM) signals using time-division multiplexing (TDM) at an overall rate of 1.544 Mbps.

Currently, only bipolar 8-zero line coding is supported.

# interfaces serial t3-options

Specifies the physical line characteristics for T3 serial interfaces.

---

## Command Mode

Configuration mode.

---

## Syntax

<code>set interfaces serial name t3-options...</code>	Use <b>set</b> to configure physical line characteristics for a T3 serial interface, or to modify T3 serial interface configuration.
<code>delete interfaces serial name t3-options...</code>	Use <b>delete</b> to delete configuration for a T3 serial interface.

---

## Configuration Statement

```
interfaces {  
  serial [wan0..wan23] {  
    t3-options {  
      framing: [c-bit|m13]  
      line-coding: [ami|b8zs]  
    }  
  }  
}
```

---

## Parameters

<b>framing</b>	Optional. Sets the frame type for the interface. Supported values are as follows:  <b>c-bit</b> : Sets the T3 frame type to C-bit parity <b>m13</b> : Sets the T3 frame type to M13.  The default is <b>c-bit</b> .
<b>line-coding</b>	Optional. Sets the T3 line coding. Supported values are as follows:  <b>ami</b> : Sets the line coding to alternate mark inversion (AMI). <b>b8zs</b> : Sets the line coding to bipolar 8-zero substitution.  The default is <b>b8zs</b> .

---

## Usage Guidelines

Use this command to specify the physical line characteristics of traffic that will pass through this T3 serial interface.

Configuring this option designates this interface as a T3 interface for transmitting digital signals in the T-carrier system used in the United States, Japan, and Canada. The T3 signal format carries multiple T1 channels multiplexed, resulting in transmission rates of up to 44.736 Mbit/s.

# show interfaces serial

Displays information about a specific serial interface.

---

## Command Mode

Operational mode.

---

## Syntax

```
show interfaces serial [wan0..wan23  
    {cisco-hdlc |  
    frame-relay [pvc-list [active|inactive]| pvc [dlci]] |  
    physical |  
    ppp}]
```

---

## Parameters

<b>cisco-hdlc</b>	Shows Cisco HDLC information for the specified serial interface.
<b>frame-relay</b>	Shows Frame Relay information for the specified serial interface.
<b>pvc-list</b>	Lists of Frame Relay permanent virtual circuits (PVCs). When used with no option, displays all configured PVCs.
<b>active</b>	Lists only active Frame Relay PVCs.
<b>inactive</b>	Lists only inactive Frame Relay PVCs.
<b>pvc</b>	Displays details for Frame Relay PVCs. When used with no option, displays information for all configured PVCs.
<i>dlci</i>	Displays details for just the specified Frame Relay DLCI.
<b>ppp</b>	Shows Point-to-Point protocol information for the specified serial interface.

---

## Usage Guidelines

Use this command to view the operational status of a serial interface.

When used with no option, this command displays information for all available serial interfaces. If an interface is specified, you must also specify one of the **cisco-hdlc**, **frame-relay**, or **ppp** options.

---

## Examples

Example 4-1 shows the first screen of output for **show interfaces serial**.

Example 4-1 “show interfaces serial”: Displaying serial interface information

---

```
vyatta@R1> show interfaces serial
wan0: <POINTOPOINT,NOARP,UP,10000> mtu 1500 qdisc pfifo_fast
qlen 100
    link/ppp

RX: bytes  packets  errors  dropped overrun mcast
44         4         0        0         0         0
TX: bytes  packets  errors  dropped carrier collsns
44         4         0        0         0         0
```

---

Example 4-1 shows the first screen of output for **show interfaces serial wanx ppp**.

Example 4-2 “show interfaces serial wanx ppp”

---

```
vyatta@ppp> show interfaces serial wan0 ppp

-----
wan0.1: PPP AUTHENTICATION
-----

Allow the use of PAP for inbound/outbound: No
Allow the use of CHAP for inbound/outbound: No

-----
wan0.1: PPP IP CONFIGURATION
-----

Enable the use of IP: No
Notify remote of locally-configure address: No
Local IP address( 0.0.0.0 = request ): 0.0.0.0
Request remote to provide local address: No
Provide remote with pre-configured address: No
```

```
Remote IP address: 0.0.0.0
Require that remote provide an address: No
```

```
-----
wan0.1: GENERAL CONFIGURATION 502 Board
-----
```

```
--More--
```

---

## Chapter 5: Basic Services

This chapter describes commands required to deploy basic protocol services such as DHCP, HTTP, SSH, and Telnet.

This chapter contains the following commands.

Command	Mode	Description
<code>clear dhcp leases</code>	Operational	Removes current DHCP leases.
<code>service dhcp relay</code>	Configuration	Configures the router to relay DHCP client messages to an off-net DHCP server.
<code>service dhcp-server</code>	Configuration	Configures the DHCP service on the router.
<code>service http</code>	Configuration	Configures HTTP as an access protocol on the router.
<code>service ssh</code>	Configuration	Configures SSH as an access protocol on the router.
<code>service telnet</code>	Configuration	Configures Telnet as an access protocol on the router.
<code>show dhcp leases</code>	Operational	Displays current DHCP lease information.
<code>show dhcp statistics</code>	Operational	Displays DHCP server statistics.

# clear dhcp leases

Removes current DHCP leases.

---

## Command Mode

Operational mode.

---

## Syntax

```
clear dhcp leases [ipv4]
```

---

## Parameters

<i>ipv4</i>	Clears the DHCP lease for the specified IP address.
-------------	---

---

## Usage Guidelines

Use this command to remove DHCP leases.

When used with no option, this command clears all current leases. When an IP address is specified, this command clears the for the host at the specified address.

DHCP is configured using the the **service dhcp-server** command (see page 134).

## service dhcp relay

Configures the router to relay DHCP client messages to an off-net DHCP server.

---

### Command Mode

Configuration mode.

---

### Syntax

```
set service dhcp relay  
  interface text ...
```

Use **set** to create a new DHCP relay agent, or to modify DHCP relay configuration.

Note that you cannot use **set** to change the interface for an existing relay agent, or to change the identifiers of subordinate configuration nodes. To change this information, you must **delete** the entry and then **set** it again using the correct information.

```
delete service dhcp relay  
  interface text ...
```

Use **delete** to delete optional values for a DHCP relay agent.

You cannot delete mandatory values within a configuration node.

---

### Configuration Statement

```
service {  
  dhcp {  
    relay {  
      interface: [all|eth0..eth23]{  
        server: ipv4 {}  
        relay-options {  
          port: 1-65535  
          max-size: 64-1400  
          hop-count: 1-255  
          relay-agents-packets: [discard|forward]  
        }  
      }  
    }  
  }  
}
```

---

## Parameters

<b>interface</b>	<p>Mandatory. Multi-node. The interface to use to relaying DHCP client messages.</p> <p>You can relay DHCP client messages through more than one interface by creating multiple <b>interface</b> configuration nodes.</p>
<b>server</b>	<p>Mandatory. Multi-node. The IP address of the DHCP server.</p> <p>You can relay messages to more than one DHCP server, by creating multiple <b>server</b> configuration nodes.</p>
<b>relay-options</b>	<p>Optional. If relay options are configured, the router adds Relay Agent Information option (option 82) to the client-to-server packet, as specified by RFC 3046.</p>
<b>port</b>	<p>Optional. The port on this interface to be used for relaying DHCP client messages. The range is 1 to 65535. The default is 67.</p>
<b>max-size</b>	<p>Optional. The maximum size of the DHCP packet to be created after appending the relay agent information option. If, after appending the information, the packet would exceed this size, the packet is forwarded without appending the information.</p> <p>If this option is not configured, the router does not forward DHCP packets that exceed the MTU of the interface on which relaying is configured.</p> <p>The range is 64 to 1400. The default is 576.</p>
<b>hop-count</b>	<p>Optional. The time-to-live for outgoing relayed messages. The range is 1 to 255. The default is 10.</p>
<b>relay-agents-packets</b>	<p>Optional. Sets the reforwarding policy for a DHCP relay agent. This is the action the router will take if the DHCP message already contains relay information. Supported values are as follows:</p> <p><b>discard:</b> If the packet already contains relay information, it will be discarded.</p> <p><b>forward:</b> The packet will be forwarded regardless of whether it contains relay information.</p> <p>The default is <b>forward</b>.</p>

---

---

## Usage Guidelines

Use this command to configure the router as a DHCP relay agent.

A DHCP relay agent receives DHCP packets from DHCP clients and forwards them to a DHCP server. This allows you to place DHCP Clients and DHCP servers on different networks; that is, across router interfaces.

The relay agent is configured with addresses of DHCP servers to which they should relay client DHCP message. The relay agent intercepts the broadcast, sets the gateway address (the **giaddr** field of the DHCP packet) and, if configured, inserts the Relay Agent Information option (option 82) in the packet and forwards it to the DHCP server.

The DHCP server echoes the option back verbatim to the relay agent in server-to-client replies, and the relay agent strips the option before forwarding the reply to the client.

# service dhcp-server

Configures the DHCP service on the router.

---

## Command Mode

Configuration mode.

---

## Syntax

<pre>set service dhcp-server name text ...</pre>	<p>Use <b>set</b> to create a new DHCP address pool, or to modify address pool configuration.</p> <p>Note that you cannot use <b>set</b> to change the name of an existing address pool, or change the identifiers of other configuration nodes. To change this information, you must <b>delete</b> the entry and then <b>set</b> it again using the correct information.</p>
<pre>delete service dhcp-server name text ...</pre>	<p>Use <b>delete</b> to delete optional values for an address pool. You can also use <b>delete</b> to remove an entire address pool. If you delete the last address pool, DHCP will not be available as a service.</p> <p>Within an address pool, you cannot delete mandatory values, such as <b>interface</b> or <b>netmask</b>.</p>

---

## Configuration Statement

```
service {  
  dhcp-server {  
    name text {  
      interface: eth0..eth23  
      network-mask: 0-32  
      start ipv4 {  
        stop: ipv4  
      }  
      exclude: ipv4 {}  
      static-mapping: text {  
        ip-address: ipv4  
        mac-address: macaddr  
      }  
      dns-server ipv4 {}  
      default-router: ipv4  
      wins-server ipv4 {}  
    }  
  }  
}
```

```

        lease: 120-4294967296
        domain-name: text
        authoritative: [enable|disable]
    }
}

```

## Parameters

<b>name</b>	<p>Mandatory. Multi-node. Creates a DHCP server address pool with the specified name.</p> <p>You can define multiple address pools by creating multiple <b>name</b> configuration nodes, each with a different name.</p>
<b>interface</b>	<p>Mandatory. The router interface bound to this DHCP address pool. The interface must already be configured on the router.</p>
<b>network-mask</b>	<p>Mandatory. Defines the size of the subnet served by this pool of addresses. The range is 0 to 32.</p>
<b>start</b>	<p>Optional. Multi-node. The start address in an address range. This is the first address in the range that can be assigned.</p> <p>You can define multiple address ranges within an address pool, by creating multiple <b>start</b> configuration nodes.</p>
<b>stop</b>	<p>Mandatory. The stop address in this address range. This is the last address in the range that can be assigned.</p>
<b>exclude</b>	<p>Optional. Multi-node. Allows you to exclude an IP address from the address pool. The router will not assign these IP addresses to any devices.</p> <p>You can exclude multiple addresses within an address pool, by creating multiple <b>exclude</b> configuration nodes.</p>
<b>static-mapping</b>	<p>Optional. Multi-node. Allows you to statically map an IP address within an address pool to the MAC address of a device on the network.</p> <p>You can define multiple static mappings of this type by creating multiple <b>static-mapping</b> configuration nodes.</p>
<b>ip-address</b>	<p>Mandatory. The IP address to be statically assigned to the device.</p>
<b>mac-address</b>	<p>Mandatory. The MAC address to be statically mapped to the specified IP address.</p>

<b>dns-server</b>	Optional. Multi-node. Gives the address of a DNS server that is available to DHCP clients on this subnet. You can specify more than one DNS server by issuing this statement multiple times. The format is an IP address.
<b>default-router</b>	Optional. Gives the address of the default router for DHCP clients on this subnet. The default router should be on the same subnet as the client. The format is an IP address.
<b>wins-server</b>	Optional. Multi-node. Gives the address of a NetBIOS Windows Internet Naming Server (WINS) available to DHCP clients on this subnet. The WINS server provides a name resolution services the Microsoft DHCP clients can use to correlate host names to IP addresses.  You can specify more than one WINS server by issuing this statement multiple times. The format is an IP address.
<b>lease</b>	Optional. Specifies how long the address assigned by the DHCP server will be valid, in seconds. The range is 120 to 4294967296. The default is 86400 (24 hours).
<b>domain-name</b>	Optional. The client domain-name to configure. A domain name can include letters, numbers, hyphens ("-"), and one period (".").
<b>authoritative</b>	Optional. Enables and disables authoritative state. Supported values are as follows:  <b>enable</b> : Enables authoritative state.  <b>disable</b> : Disables authoritative state.  The default is <b>disable</b> .

## Usage Guidelines

Use this command to configures a pool of addresses the router can use for Dynamic Host Configuration Protocol (DHCP).

At least one address pool must be configured for DHCP to be available as a service.

Each subnet requires a distinct address pool. A given interface can support more than one address pool (that is, more than one subnet), but it must have an IP address for each subnet it is supporting.

# service http

Configures HTTP as an access protocol on the router.

---

## Command Mode

Configuration mode.

---

## Syntax

<code>set service http ...</code>	Use <b>set</b> to enable or disable the HTTP service, or set the port to be used for HTTP.
<code>delete service http ...</code>	Use <b>delete</b> to delete the specified port configuration, resetting to the default value. You can also use <b>delete</b> to delete the HTTP configuration node. This disables HTTP access to the router.

---

## Configuration Statement

```
service {  
    http {  
        port: 1-65534  
    }  
}
```

---

## Parameters

<b>port</b>	The port the system will use for the HTTP service. The range is 1 to 65534. The default is 80.
-------------	--

---

## Usage Guidelines

Use this command to configure the router to allow HTTP requests from remote systems to the local router.

Creating the HTTP configuration node enables HTTP as an access protocol. By default, the router uses port 80 for the HTTP service.

## service ssh

Configures SSH as an access protocol on the router.

---

### Command Mode

Configuration mode.

---

### Syntax

`set service ssh ...`

Use **set** to create the SSH configuration node. This enables the SSH service. You can also use **set** to set the port value or protocol version after the SSH configuration node has been created.

`delete service ssh ...`

Use **delete** to delete the specified port or protocol version configuration, resetting to the default values. You can also use **delete** to delete the SSH configuration node. This disables SSH access to the router.

---

### Configuration Statement

```
service {
  ssh {
    port: 1-65534
    protocol-version: [v1|v2|all]
  }
}
```

---

### Parameters

<b>port</b>	The port the system will use for the SSH service. The range is 1 to 65534. The default is port 22.
<b>protocol-version</b>	Specifies which versions of SSH are enabled. Supported values are as follows:  <b>v1</b> : SSH version 1 is enabled. <b>v2</b> : SSH version 2 is enabled. <b>all</b> : Both SSH version 1 and SSH version 2 are enabled.  The default is <b>v2</b> .

---

## Usage Guidelines

Use this command to configure the router to allow SSH requests from remote systems to the local router.

Creating the SSH configuration node enables SSH as an access protocol. By default, the router uses port 22 for the SSH service, and SSH version 2 alone is used.

## service telnet

Configures Telnet as an access protocol on the router.

---

### Command Mode

Configuration mode.

---

### Syntax

<code>set service telnet ...</code>	Use <b>set</b> to create the <b>telnet</b> configuration node. This enables the Telnet service. You can also use <b>set</b> to set the port value after the Telnet configuration node has been created.
<code>delete service telnet ...</code>	Use <b>delete</b> to delete the specified port or protocol version configuration, resetting to the default values. You can also use <b>delete</b> to delete the Telnet configuration node. This disables Telnet access to the router.

---

### Configuration Statement

```
service {  
    telnet {  
        port: 1-65534  
    }  
}
```

---

### Parameters

<b>port</b>	The port the system will use for the Telnet service. The range is 1 to 65534. The default is port 23.
-------------	---

---

### Usage Guidelines

Use this command to configure the router to accept Telnet as an access service to the router. Creating the Telnet configuration node enables Telnet as an access protocol. By default, the router uses port 23 for the Telnet service.

## show dhcp leases

Displays current DHCP lease information.

---

### Command Mode

Operational mode.

---

### Syntax

```
show dhcp leases [pool name]
```

---

### Parameters

---

<b>pool</b>	Shows lease information for the specified address pool.
-------------	---

---

---

### Usage Guidelines

Use this command to see current lease information for DHCP subscribers.

When used with no option, this command displays all current lease information. When address pool is provided, this command displays lease information for the specified address pool.

DHCP is configured using the the **service dhcp-server** command (see page 134).

# show dhcp statistics

Displays DHCP server statistics.

---

## Command Mode

Operational mode.

---

## Syntax

```
show dhcp statistics [server-name]
```

---

## Parameters

---

<i>server-name</i>	Shows statistics for the specified DHCP server.
--------------------	---

---

---

## Usage Guidelines

Use this command to see current lease information for DHCP subscribers.

When used with no option, this command displays all current lease information. When address pool is provided, this command displays lease information for the specified address pool.

The information shown includes the following:

- Number of DHCP requests
- Number of DHCP responses
- Total addresses in pool
- Number of addresses available
- Number of addresses assigned
- IP subnet(s) in pool
- Interface on which the DHCP pool is configured

DHCP is configured using the the **service dhcp-server** command (see page 134).

## Chapter 6: Forwarding and Routing

This chapter lists commands for enabling and disabling forwarding, and for displaying general routing information.

This chapter contains the following commands.

Command	Mode	Description
<code>multicast mfea4</code>	Configuration	Enables or disables multicast forwarding for IPv4.
<code>multicast mfea6</code>	Configuration	Enables or disables multicast forwarding for IPv6.
<code>protocols fib2mrib</code>	Configuration	Enables or disables the FIB2MRIB module, which adds routing entries to the Multicast Routing Information Base.
<code>show mfea dataflow</code>	Operational	Displays information about IPv4 multicast forwarding data filters.
<code>show mfea interface</code>	Operational	Displays information about IPv4 multicast interfaces.
<code>show mfea6 dataflow</code>	Operational	Displays information about IPv6 multicast forwarding data filters.
<code>show mfea6 interface</code>	Operational	Displays information about IPv6 multicast interfaces.
<code>show route</code>	Operational	Displays information about routes stored in the routing table.

# multicast mfea4

Enables or disables multicast forwarding for IPv4.

---

## Command Mode

Configuration mode.

---

## Syntax

<code>set multicast mfea4 ...</code>	Use <b>set</b> to enable or disable multicast forwarding for IPv4.
<code>delete multicast mfea4 ...</code>	Use <b>delete</b> to delete the <b>multicast mfea4</b> configuration node. This disables multicast forwarding for IPv4.

---

## Configuration Statement

```
mfea4 {
  disable:bool
  interface: eth0..eth23
  traceoptions {
    flag {
      all {
        disable:bool
      }
    }
  }
}
```

---

## Parameters

---

<b>disable</b>	Enables or disables multicast forwarding for IPv4. Supported values are:  <b>true</b> —Disables multicast forwarding for IPv4, without discarding configuration.  <b>false</b> —Enables multicast forwarding for IPv4.  The default is <b>false</b> .
----------------	---

---

---

<b>interface</b>	<p>Multi-node. The network interface to enable IPv4 multicast forwarding on. The network interface must already be created and configured.</p> <p>(See Chapter 3: Ethernet Interfaces, VLANs, and Bridging” for information on creating and configuring network interfaces.)</p> <p>You can enable IPv4 multicast forwarding on more than one interface by creating multiple <b>interface</b> configuration nodes within the <b>multicast mfea4</b> node.</p>
<b>traceoptions</b>	<p>Sets the tracing and debugging options for IPv4 multicast forwarding.</p>
<b>flag</b>	<p>Specifies which tracing options are enabled.</p>
<b>all</b>	<p>Enables or disables all tracing options.</p>
<b>disable</b>	<p>Optional. Enables or disables debugging output for IPv4 multicast forwarding. Supported values are as follows:</p> <p><b>true</b>—Disables debugging output for IPv4 multicast forwarding.</p> <p><b>false</b>—Enables debugging output for IPv4 multicast forwarding.</p> <p>The default is <b>false</b>.</p>

---

---

## Usage Guidelines

Use this command to enable or disable multicast forwarding for IPv4.

Unicast forwarding is automatically enabled on the Vyatta OFR, but multicast forwarding must be explicitly enabled. You must enable multicast forwarding on each interface on which you intend to route multicast traffic.

# multicast mfea6

Enables or disables multicast forwarding for IPv6.

---

## Command Mode

Configuration mode.

---

## Syntax

<code>set multicast mfea6 ...</code>	Use <b>set</b> to enable or disable multicast forwarding for IPv6.
<code>delete multicast mfea6 ...</code>	Use <b>delete</b> to delete the <b>multicast mfea6</b> configuration node. This disables multicast forwarding for IPv6.

---

## Configuration Statement

```
mfea6 {  
    disable:bool  
    interface: eth0..eth23  
    traceoptions {  
        flag {  
            all {  
                disable:bool  
            }  
        }  
    }  
}
```

---

## Parameters

<b>disable</b>	Enables or disables multicast forwarding for IPv6. Supported values are:  <b>true</b> —Disables multicast forwarding for IPv6, without discarding configuration. <b>false</b> —Enables multicast forwarding for IPv6. The default is <b>false</b> .
----------------	---

---

---

<b>interface</b>	<p>Multi-node. The network interface to enable IPv6 multicast forwarding on. The network interface must already be created and configured.</p> <p>(See Chapter 3: Ethernet Interfaces, VLANs, and Bridging” for information on creating and configuring network interfaces.)</p> <p>You can enable IPv6 multicast forwarding on more than one interface by creating multiple <b>interface</b> configuration nodes within the <b>multicast mfea6</b> node.</p>
<b>traceoptions</b>	<p>Sets the tracing and debugging options for IPv6 multicast forwarding.</p>
<b>flag</b>	<p>Specifies which tracing options are enabled.</p>
<b>all</b>	<p>Enables or disables all tracing options.</p>
<b>disable</b>	<p>Optional. Enables or disables debugging output for IPv64 multicast forwarding. Supported values are as follows:</p> <p><b>true</b>—Disables debugging output for IPv6 multicast forwarding.</p> <p><b>false</b>—Enables debugging output for IPv6 multicast forwarding.</p> <p>The default is <b>false</b>.</p>

---

---

## Usage Guidelines

Use this command to enable or disable multicast forwarding for IPv64.

Unicast forwarding is automatically enabled on the Vyatta OFR, but multicast forwarding must be explicitly enabled. You must enable multicast forwarding on each interface on which you intend to route multicast traffic.

## protocols fib2mrib

Enables or disables the FIB2MRIB module, which adds routing entries to the Multicast Routing Information Base.

---

### Command Mode

Configuration mode.

---

### Syntax

<code>set protocols fib2mrib ...</code>	Use <b>set</b> to enable or disable the FIB2MRIB module.
<code>delete interfaces bridge ...</code>	Use <b>delete</b> to delete the FIB2MRIB module. This means that unicast routing information will not be replicated into the Multicast RIB.

---

### Configuration Statement

---

### Parameters

<b>disable</b>	Enables or disables the FIB2MRIB module. Supported values are:  <b>true</b> —Disables the FIB2MRIB module. <b>false</b> —Enables the FIB2MRIB module.  The default is <b>false</b> (that is, when created, the module is automatically enabled).
----------------	---

---

### Usage Guidelines

Use this command to enable or disable the FIB2MRIB.

If there are no unicast routing protocols configured in the router to supply the MRIB routes, then the FIB2MRIB module can be used to populate the MRIB. If the FIB2MRIB module is enabled, it will register with the Forwarding Engine Abstraction (FEA) to read the whole unicast forwarding table from the underlying system, and to receive notifications for all future modifications of that table. In other words, the FIB2MRIB's task is to replicate the unicast forwarding information on that router into the MRIB.

---

## Examples

Example 6-1 creates the FIB2MRIB module. By default, this module is enabled when created.

### Example 6-1 Populating the MRIB using the FIB2MRIB module

---

```
vyatta@R1# set protocols fib2mrib
[edit]
vyatta@R1# commit
[edit]
OK
vyatta@R1# show protocols fib2mrib

[edit]
vyatta@R1# show -all protocols fib2mrib
    disable: false

[edit]
vyatta@R1#
```

---

# show mfea dataflow

Displays information about IPv4 multicast forwarding data filters.

---

## Command Mode

Operational mode.

---

## Configuration Statement

```
show mfea dataflow
```

---

## Parameters

None

---

## Usage Guidelines

Use this command to view information about IPv4 multicast forwarding data filters.

This command is only available once the **multicast mfea4** configuration node has been created.

## show mfea interface

Displays information about IPv4 multicast interfaces.

---

### Command Mode

Operational mode.

---

### Configuration Statement

```
show mfea interface int-name [address ipv4]
```

---

### Parameters

<i>int-name</i>	Displays information for the specified Ethernet interface.
<b>address</b>	Displays information for the specified IPv4 multicast address.

---

### Usage Guidelines

Use this command to view information about IPv4 multicast interfaces.

This command is only available once the **multicast mfea4** configuration node has been created.

## show mfea6 dataflow

Displays information about IPv6 multicast forwarding data filters.

---

### Command Mode

Operational mode.

---

### Configuration Statement

```
show mfea6 dataflow
```

---

### Parameters

None

---

### Usage Guidelines

Use this command to view information about IPv6 multicast forwarding data filters.

This command is only available once the **multicast mfea6** configuration node has been created.

## show mfea6 interface

Displays information about IPv6 multicast interfaces.

---

### Command Mode

Operational mode.

---

### Configuration Statement

```
show mfea6 interface int-name [address ipv6]
```

---

### Parameters

<i>int-name</i>	Displays information for the specified Ethernet interface.
<b>address</b>	Displays information for the specified IPv6 multicast address.

---

### Usage Guidelines

Use this command to view information about IPv6 multicast interfaces.

This command is only available once the **multicast mfea6** configuration node has been created.

## show route

Displays information about routes stored in the routing table.

---

### Command Mode

Operational mode.

---

### Syntax

```
show route [[exact] prefix |  
            protocol text |  
            prefix-length 0-32 |  
            next-hop {ipv4 / ipv6} /  
            system [forward]]
```

---

### Parameters

<b>exact</b>	Displays exact prefix matches only.
<b>prefix</b>	<p>Lists all active prefixes matching the specified prefix. When used without the <b>exact</b> option, this includes both prefixes that are exact matches and prefixes that are longer than the specified prefix. The format is <i>ip-address/prefix-length</i>.</p> <p>For example, for a prefix of <b>10.0.0.0/8</b> all routes matching 10.0.0.0/8 or longer (<b>10.0.0.0/16</b>, <b>10.1.0.0/24</b>, and so on) are displayed.</p>
<b>protocol</b>	<p>Displays all the active prefixes in the RIB that were learned through the specified protocol. Supported values are as follows:</p> <p><b>connected</b>: Displays directly connected routes.</p> <p><b>static</b>: Displays static routes</p> <p><b>bgp</b>: Displays both iBGP and eBGP routes.</p> <p><b>ibgp</b>: Displays iBGP routes only.</p> <p><b>ebgp</b>: Displays eBGP routes only.</p> <p><b>rip</b>: Displays RIP routes.</p> <p><b>ospf</b>: Displays OSPF routes.</p>
<b>prefix-length</b>	Lists all active prefixes that have the specified prefix-length. The range is 0 to 32.
<b>next-hop</b>	Lists all the active prefixes that have the specified IPv4 or IPv6 address as the next hop.

---

<b>system</b>	Lists all routes in the system routing table.
<b>forward</b>	Lists all routes in the system forwarding table.

---

---

## Usage Guidelines

Use this command to display route information.

When used with no option, this command lists all the active prefixes stored in the Routing Information Base (RIB), with summary information at the top. The summary information includes the following:

- Total routes. The number of prefixes in the RIB.
- Total paths. The number of routes in the RIB. This will be equal to the total routes unless there are routes with multiple next-hops.
- Routes in this view. The number of prefixes in the RIB matching the specified option.
- Paths in this view. The number of routes in the RIB matching the specified option. This will be equal to the total routes unless there are routes with multiple next-hops.

---

## Examples

Example 6-2 shows all routes in the RIB using the default output format (brief).

Example 6-2 “show route”: Displaying routes

---

```
vyatta@vyatta> show route
Total routes: 13, Total paths: 13
10.0.0.0/8      [static(1)]    > to 192.168.2.1 via eth2/eth2
10.0.0.0/24     [connected(0)]  > to 10.0.0.50 via eth0/eth0
25.0.0.0/8      [ebgp(0)]       > to 10.0.0.100 via eth0/eth0
25.25.0.0/16    [ebgp(0)]       > to 10.0.0.100 via eth0/eth0
25.25.25.0/24   [ebgp(0)]       > to 10.0.0.100 via eth0/eth0
26.0.0.0/8      [ospf(1)]       > to 10.0.0.100 via eth0/eth0
26.26.0.0/16    [ospf(1)]       > to 10.0.0.100 via eth0/eth0
26.26.26.0/24   [ospf(1)]       > to 10.0.0.100 via eth0/eth0
27.0.0.0/8      [rip(2)]        > to 10.0.0.100 via eth0/eth0
27.27.0.0/16    [rip(2)]        > to 10.0.0.100 via eth0/eth0
27.27.27.0/24   [rip(2)]        > to 10.0.0.100 via eth0/eth0
172.16.0.0/14   [connected(0)]  > to 172.16.0.50 via eth1/eth1
192.168.2.0/24  [connected(0)]  > to 192.168.2.31 via eth2/eth2
```

---

Example 6-3 displays static routes.

---

**Example 6-3 “show route”: Displaying static routes**

---

```
vyatta@vyatta> show route protocol static
Total routes: 13, Total paths: 13
Routes in this view: 1, Paths in this view: 1

10.0.0.0/8      [static(1)]      > to 192.168.2.1 via eth2/eth2
```

---

Example 6-4 displays routes with a prefix length of 16.

---

**Example 6-4 “show route”: Displaying routes of a specified prefix length**

---

```
vyatta@vyatta> show route prefix-length 16
Total routes: 13, Total paths: 13
Routes in this view: 2, Paths in this view: 2

25.25.0.0/16    [ebgp(0)]         > to 10.0.0.100 via eth0/eth0
26.26.0.0/16    [ospf(1)]         > to 10.0.0.100 via eth0/eth0
27.27.0.0/16    [rip(2)]          > to 10.0.0.100 via eth0/eth0
```

---

Example 6-5 displays routes with a next hop of 10.0.0.100.

---

**Example 6-5 “show route”: Displaying routes with a specified next hop**

---

```
vyatta@vyatta> show route next-hop 10.0.0.100
Total routes: 13, Total paths: 13
Routes in this view: 9, Paths in this view: 9

25.0.0.0/8      [ebgp(0)]         > to 10.0.0.100 via eth0/eth0
25.25.0.0/16    [ebgp(0)]         > to 10.0.0.100 via eth0/eth0
25.25.25.0/24   [ebgp(0)]         > to 10.0.0.100 via eth0/eth0
26.0.0.0/8      [ospf(1)]         > to 10.0.0.100 via eth0/eth0
26.26.0.0/16    [ospf(1)]         > to 10.0.0.100 via eth0/eth0
26.26.26.0/24   [ospf(1)]         > to 10.0.0.100 via eth0/eth0
27.0.0.0/8      [rip(2)]          > to 10.0.0.100 via eth0/eth0
27.27.0.0/16    [rip(2)]          > to 10.0.0.100 via eth0/eth0
27.27.27.0/24   [rip(2)]          > to 10.0.0.100 via eth0/eth0
```

---

Example 6-6 pipes the output of the **show route system forward** command through the UNIX **count** command, to display the total number of entries in the system forwarding table.

Example 6-6 “show route”: Piping output through a UNIX command

---

```
vyatta@vyatta> show route system forward | count
```

```
Count: 137937 lines
```

```
vyatta@vyatta>
```

---

## Chapter 7: Static Routes

This chapter lists the commands for configuring static routes on the Vyatta OFR.

A static route is a manually configured route, which in general cannot be updated dynamically from information the router learns about the network topology. However, if a link fails, the router will remove routes, including static routes, from the RIB that used that interface to reach the next hop.

This chapter contains the following commands.

Command	Mode	Description
<code>protocols static</code>	Configuration	Allows you to configure unicast and multicast static routes.

*See also* the following commands in other chapters.

<code>policy as-path-list</code>	Configuration	Allows you to create a list of AS paths, which can be referenced in BGP policy statements. <i>See page 278.</i>
<code>show route</code>	Operational	This chapter lists commands for enabling and disabling forwarding, and for displaying general routing information. <i>See page 155.</i>

## protocols static

Allows you to configure unicast and multicast static routes.

---

### Command Mode

Configuration mode.

---

### Syntax

`set protocols static ...`

Use **set** to create the **static** configuration node, or to change static route configuration.

Note that you cannot use **set** to change the identifier of a configuration node. To change this information, delete the old node and create a new configuration node with the correct information.

`delete protocols static ...`

Use **delete** to delete the static configuration node altogether, to delete a specific route, or to delete an import policy.

---

### Configuration Statement

```
protocols {
  static {
    disable: [true|false]
    route: ipv4net {
      next-hop: ipv4
      metric: 1-65535
    }
    interface-route: ipv4net {
      next-hop-interface: text
      next-hop-router: ipv4
      metric: 1-65535
    }
    import: text
  }
}
```

---

## Parameters

<b>disable</b>	<p>Specifies whether any static routes are installed or not. Supported values are as follows:</p> <p><b>true</b>—Deletes the entire static routes configuration, but without removing configuration information.</p> <p><b>false</b>—Enables the static routes configuration that has been specified.</p> <p>The default is <b>false</b>.</p>
<b>route</b>	<p>Multi-node. Defines a unicast route. The format is a destination subnet of the form <i>address/prefix</i>.</p> <p>You can define multiple routes by creating multiple <b>route</b> configuration nodes.</p>
<b>next-hop</b>	<p>Mandatory. The IPv4 address of the next-hop router toward the destination subnet.</p>
<b>metric</b>	<p>Optional. The routing metric or cost for this route. The format is a non-negative integer, where lower values indicate better routes.</p> <p>The metric for a static route is not directly used to decide which route to use, but may affect the choice of routes for protocols such as BGP or PIM-SM that indirectly use this information. For example, BGP uses the IGP metric to the next hop to decide between alternative routes as part of its decision process.</p> <p>The default metric is 1.</p>
<b>interface-route</b>	<p>Multi-node. Defines a interface-based static route. The format is a destination subnet of the form <i>address/prefix</i>.</p> <p>You can define multiple interface-based routes by creating multiple <b>interface-route</b> configuration nodes.</p>
<b>next-hop-interface</b>	<p>Mandatory. The name of the next-hop interface toward the destination subnet.</p>
<b>next-hop-router</b>	<p>Optional. The address of the next-hop router. The default is 0.0.0.0.</p>

---

---

<b>metric</b>	<p>Optional. The routing metric or cost for this route. The format is a non-negative integer, where lower values indicate better routes.</p> <p>The metric for a static route is not directly used to decide which route to use, but may affect the choice of routes for protocols such as BGP or PIM-SM that indirectly use this information. For example, BGP uses the IGP metric to the next hop to decide between alternative routes as part of its decision process.</p> <p>The default metric is 1.</p>
<b>import</b>	<p>The name of an import routing policy.</p>

---

---

### Usage Guidelines

Use this command to configure static routes on the router, or to specify import policies to be applied to static routes. You can configure unicast and multicast routes.

## Chapter 8: RIP

This chapter lists the commands for setting up the Routing Information Protocol (RIP) on the Vyatta OFR.

This chapter contains the following commands.

Command	Mode	Description
<code>protocols rip</code>		Allows you to configure RIP for IPv4 on the router.
<code>protocols ripng</code>		Allows you to configure RIP for IPv6 on the router.
<code>show rip peer</code>		Displays information for the RIP peers of this router.
<code>show rip statistics</code>		Displays RIP statistics.
<code>show rip status</code>		Displays RIP status.

*See also* the following commands in other chapters.

<code>policy as-path-list</code>	Configuration	Allows you to create a list of AS paths, which can be referenced in BGP policy statements. <i>See page 278.</i>
<code>show route</code>	Operational	Displays information about routes stored in the routing table. <i>See page 155.</i>

**D R A F T**

## protocols rip

Allows you to configure RIP for IPv4 on the router.

---

### Syntax

<code>set protocols rip ...</code>	Use <b>set</b> to create the <b>rip</b> configuration node, or to modify RIP configuration.  Note that you cannot use <b>set</b> to change the identifier of a configuration node. To change this information, delete the old node and create a new node with the correct information.
<code>delete protocols rip ...</code>	Use <b>delete</b> to delete the <b>rip</b> configuration node altogether, or to delete one of its subordinate nodes.

---

### Command Mode

Configuration mode.

---

### Configuration Statement

```

protocols {
  rip {
    interface: text {
      address: ipv4 {
        metric: 0-16
        horizon:
          [none|split-horizon|split-horizon-poison-reverse]
        disable: [true|false]
        passive: [true|false]
        accept-non-rip-requests: [true|false]
        accept-default-route: [true|false]
        advertise-default-route: [true|false]
        route-timeout: 1-4294967296
        route-expiry-secs: 1-4294967296
        deletion-delay: 1-4294967296
        route-deletion-secs: 1-4294967296
        triggered-delay: 1-4294967296
        triggered-jitter: 1-4294967296
        update-interval: 1-4294967296
        update-jitter: 1-4294967296
        request-interval: 1-4294967296
        interpacket-delay: 1-4294967296
        authentication {
          simple-password: text
        }
      }
    }
  }
}

```

```

        md5: 0-255 {
            password: text
            start-time: YYYY-MM-DD.HH:MM
            end-time: YYYY-MM-DD.HH:MM
        }
    }
}
import: text
export: text
}
}

```

## Parameters

### interface

Mandatory. Multi-node. The name of a network interface to be used by RIP for routing. The network interface must already be created and configured.

(See Chapter 3: Ethernet Interfaces, VLANs, and Bridging” for information on creating and configuring network interfaces.)

You can enable RIP on more than one interface by creating multiple **interface** configuration nodes within the **rip** node.

You can enable RIP on an individual vif, rather than an entire interface. To do this, refer to the vif using *int.vif* notation. For example to refer to vif 40 on interface eth0, use **eth0.40**.

### address

Mandatory. Multi-node. An IPv4 address to be used by RIP for routing. RIP will peer with other routers using this address. The address must already be created and configured on the interface.

(See Chapter 3: Ethernet Interfaces, VLANs, and Bridging” for information on configuring IP addresses.)

You can enable RIP on more than one address by creating multiple **address** configuration nodes within the **interface** node.

---

<b>metric</b>	<p>Optional. The metric or cost associated with routes received on this address. The metric is added to the cost in routes received before deciding between best routes to the same destination subnet. The sum of all the metrics across the entire RIP domain should be less than 16.</p> <p>The range is 0 to 16, where 16 means “infinity.” The default is 1.</p>
<b>horizon</b>	<p>Optional. Specifies how the router should treat RIP updates to its neighbors. Valid values are as follows:</p> <p><b>split-horizon-poison-reverse:</b> Announce routes back to neighbors from which they were learned with a metric of 16 (infinity).</p> <p><b>split-horizon:</b> Omit the route in announcements to the neighbor from which the route was learned.</p> <p><b>none:</b> Employs no strategy to eliminate failed routes.</p> <p>The default is <b>split-horizon-poison-reverse</b>. Under normal circumstances, this value is recommended.</p>
<b>disable</b>	<p>Optional. Determines whether RIP will exchange routes via this address. Supported values are as follows:</p> <p><b>true:</b> Disables RIP routing on this address, without discarding configuration.</p> <p><b>false:</b> Enables RIP routing on this address.</p> <p>The default is <b>false</b>.</p>
<b>passive</b>	<p>Optional. Determines whether RIP runs in passive mode on this address. Supported values are as follows:</p> <p><b>true:</b> Operates in passive mode, where RIP will accept routes received on this address, but will not advertise any routes to neighbors via this address.</p> <p><b>false:</b> RIP will both receive routes received on this address and advertise any routes to neighbors via this address.</p> <p>The default is <b>false</b>.</p>

---

---

<b>accept-non-rip-requests</b>	<p>Optional. Determines whether RIP will allow requests to be unicast, so that they can be sourced from non-RIP ports. Normal RIPv2 requests for routing updates are multicast to all neighbors and sourced from the RIP port. However, for monitoring purposes RIP also allows requests to be unicast, and then they can be sourced from non-RIP ports. Supported values are as follows:</p> <p><b>true:</b> Accepts RIP requests from any UDP port.</p> <p><b>false:</b> Does not accept RIP requests from non-RIP ports.</p> <p>The default is <b>true</b>.</p>
<b>accept-default-route</b>	<p>Optional. Determines whether RIP should accept a default route if it receives one from a RIP neighbor. Supported values are as follows:</p> <p><b>true:</b> Accepts a default route from a RIP neighbor.</p> <p><b>false:</b> Does not accept a default route from a RIP neighbor.</p> <p>The default is <b>true</b>.</p>
<b>advertise-default-route</b>	<p>Optional. Determines whether RIP should advertise the default route. Supported values are as follows:</p> <p><b>true:</b> Advertise the default route.</p> <p><b>false:</b> Do not advertise the default route.</p> <p>The default is <b>true</b>.</p>
<b>route-timeout</b>	<p>Optional. Sets the route expiry interval. If no periodic or triggered update of a route from this neighbor has been received within this time interval, the route is considered to have expired.</p> <p>The range is 1 to 4294967296. The default is 180 seconds, which should not normally need to be changed.</p>

---

<b>route-expiry-secs</b>	<p>Optional. Determines how long the router maintains expired routes after their metric has reached infinity. After a route has expired (that is, after the route has been assigned an infinite metric), the router must keep a copy of it for a certain time so it can be reasonably confident it has told its neighbors that the route has expired.</p> <p>The range is 1 to 4294967296. The default is 120 seconds, which should not normally need to be changed.</p>
<b>deletion-delay</b>	<p>The delay, in seconds, before an expired route is deleted from the routing information base.</p> <p>The range is 1 to 4294967296. The default is 120.</p>
<b>triggered-delay</b>	<p>Optional. Sets the interval, in seconds, for the triggered update timer.</p> <p>When a router receives a modified route from a neighbor, it does not have to wait until the next periodic update to tell the other neighbors, but instead sends a triggered update. After a triggered update is sent, a timer is set for a random period in the interval specified by <b>triggered-jitter</b>. If other changes occur that would trigger updates before the timer expires, a single update is triggered when the timer expires.</p> <p>The range is 1 to 4294967296. The default is 3.</p>
<b>triggered-jitter</b>	<p>Optional. Sets the interval, in seconds, from within which the triggered update timer will randomly select an interval for triggered updates.</p> <p>The range is 0 to 100, where zero means use no random jitter (that is, always use the time specified in <b>triggered-delay</b>). The default is 66.</p>
<b>update-interval</b>	<p>Optional. The interval, in seconds, of routing updates.</p> <p>A RIP router will typically tell its neighbors its entire routing table every 30 seconds. To avoid self-synchronization of routing updates, the precise time interval between telling each neighbor about routing updates is randomly jittered, with the delay chosen in the interval specified by <b>update-jitter</b>.</p> <p>The range is 1 to 4294967296. The default is 30.</p>

<b>update-jitter</b>	<p>Optional. Sets the interval, in seconds, from within which the update timer will randomly select an interval for routing updates.</p> <p>The range is 0 to 100, where 0 means use no random jitter (that is, always use the time specified in <b>update-interval</b>). The default is 35.</p>
<b>request-interval</b>	<p>Optional. Determines how often a route update request may be sent.</p> <p>When a RIP router has no neighbors on a address, it may periodically send a request for a route update in case a neighbor appears. This timer determines how often such a request is re-sent.</p> <p>The range is 1 to 10000, and 0, which disables route update requests. The default is 30 seconds.</p>
<b>interpacket-delay</b>	<p>Optional. The default delay, in milliseconds, between back-to-back RIP packets when an update is sent that requires multiple packets to be sent.</p> <p>The range is 1 to 4294967296. The default is 50.</p>
<b>authentication</b>	<p>Optional. The authentication mechanism used to authorize RIP updates sent and received via this address.</p>
<b>simple-password</b>	<p>Optional. The password to be used for plaintext authentication on this address.</p> <p>The default is an empty string.</p>
<b>md5</b>	<p>Multi-node. An integer specifying the MD5 authentication key. The range is 0 to 255.</p> <p>You can define more than one MD5 authentication key by creating multiple <b>md5</b> configuration nodes.</p>
<b>password</b>	<p>The password to be used for this MD5 authentication key.</p>
<b>start-time</b>	<p>The start time of the interval when this authentication key and password will be valid. The format is <i>YYYY-MM-DD.HH:MM</i>.</p>
<b>end-time</b>	<p>The end time of the interval when this authentication key and password will be valid. The format is <i>YYYY-MM-DD.HH:MM</i>.</p>

---

<b>import</b>	<p>Optional. A RIP import policy defined using the <b>policy</b> statement. The import policy will be used to evaluate routing updates received by RIP. For policy terms that match, the defined action will be taken.</p> <p>Multiple policies can be configured using a comma-separated list of policy names.</p>
<b>export</b>	<p>Optional. A RIP export policy defined using the <b>policy</b> statement. The import policy will be used to evaluate routing updates sent to neighbors. For policy terms that match, the defined action will be taken.</p> <p>Multiple policies can be configured using a comma-separated list of policy names.</p>

---

---

### Usage Guidelines

Use this command to configure RIP for IPv4 on the router. You can also use this command to announce routes.

To announce routes, you export the routes that are to be announced, using the export parameter. You can export routes on directly connected networks or static routes using the **export** *policy-name* directive.

D R A F T

## protocols ripng

Allows you to configure RIP for IPv6 on the router.

---

### Syntax

- `set protocols ripng ...` Use **set** to create the **ripng** configuration node, or to modify RIP configuration.
- Note that you cannot use **set** to change the identifier of a configuration node. To change this information, delete the old node and create a new node with the correct information.
- `delete protocols ripng ...` Use **delete** to delete the **ripng** configuration node altogether, or to delete one of its subordinate nodes.

---

### Command Mode

Configuration mode.

---

### Configuration Statement

```
protocols {
  ripng {
    interface: text {
      address: ipv6 {
        metric: 0-16
        horizon:
          [none|split-horizon|split-horizon-poison-reverse]
        disable: [true|false]
        passive: [true|false]
        accept-non-rip-requests: [true|false]
        accept-default-route: [true|false]
        advertise-default-route: [true|false]
        route-timeout: 1-4294967296
        route-expiry-secs: 1-4294967296
        deletion-delay: 1-4294967296
        route-deletion-secs: 1-4294967296
        triggered-delay: 1-4294967296
        triggered-jitter: 1-4294967296
        update-interval: 1-4294967296
        update-jitter: 1-4294967296
        request-interval: 1-4294967296
        interpacket-delay: 1-4294967296
        authentication {
```

```

        simple-password: text
        md5: 0-255 {
            password: text
            start-time: YYYY-MM-DD.HH:MM
            end-time: YYYY-MM-DD.HH:MM
        }
    }
}
import: text
export: text
}
}

```

## Parameters

### interface

Mandatory. Multi-node. The name of a network interface to be used by RIP for routing. The network interface must already be created and configured.

(See Chapter 3: Ethernet Interfaces, VLANs, and Bridging” for information on creating and configuring network interfaces.)

You can enable RIPng on more than one interface by creating multiple **interface** configuration nodes within the **rip** node.

You can enable RIPng on an individual vif, rather than an entire interface. To do this, refer to the vif using *int.vif* notation. For example to refer to vif 40 on interface eth0, use **eth0.40**.

### address

Mandatory. Multi-node. An IPv4 address to be used by RIP for routing. RIP will peer with other routers using this address. The address must already be created and configured on the interface.

(See Chapter 3: Ethernet Interfaces, VLANs, and Bridging” for information on configuring IP addresses.)

You can enable RIP on more than one address by creating multiple **address** configuration nodes within the **interface** node.

---

<b>metric</b>	<p>Optional. The metric or cost associated with routes received on this address. The metric is added to the cost in routes received before deciding between best routes to the same destination subnet. The sum of all the metrics across the entire RIP domain should be less than 16.</p> <p>The range is 0 to 16, where 16 means “infinity.” The default is 1.</p>
<b>horizon</b>	<p>Optional. Specifies how the router should treat RIP updates to its neighbors. Valid values are as follows:</p> <p><b>split-horizon-poison-reverse:</b> Announce routes back to neighbors from which they were learned with a metric of 16 (infinity).</p> <p><b>split-horizon:</b> Omit the route in announcements to the neighbor from which the route was learned.</p> <p><b>none:</b> Employs no strategy to eliminate failed routes.</p> <p>The default is <b>split-horizon-poison-reverse</b>. Under normal circumstances, this value is recommended.</p>
<b>disable</b>	<p>Optional. Determines whether RIP will exchange routes via this address. Supported values are as follows:</p> <p><b>true:</b> Disables RIP routing on this address, without discarding configuration.</p> <p><b>false:</b> Enables RIP routing on this address.</p> <p>The default is <b>false</b>.</p>
<b>passive</b>	<p>Optional. Determines whether RIP runs in passive mode on this address. Supported values are as follows:</p> <p><b>true:</b> Operates in passive mode, where RIP will accept routes received on this address, but will not advertise any routes to neighbors via this address.</p> <p><b>false:</b> RIP will both receive routes received on this address and advertise any routes to neighbors via this address.</p> <p>The default is <b>false</b>.</p>

---

---

<b>accept-non-rip-requests</b>	<p>Optional. Determines whether RIP will allow requests to be unicast, so that they can be sourced from non-RIP ports. Normal RIPv2 requests for routing updates are multicast to all neighbors and sourced from the RIP port. However, for monitoring purposes RIP also allows requests to be unicast, and then they can be sourced from non-RIP ports. Supported values are as follows:</p> <p><b>true:</b> Accepts RIP requests from any UDP port.</p> <p><b>false:</b> Does not accept RIP requests from non-RIP ports.</p> <p>The default is <b>true</b>.</p>
<b>accept-default-route</b>	<p>Optional. Determines whether RIP should accept a default route if it receives one from a RIP neighbor. Supported values are as follows:</p> <p><b>true:</b> Accepts a default route from a RIP neighbor.</p> <p><b>false:</b> Does not accept a default route from a RIP neighbor.</p> <p>The default is <b>true</b>.</p>
<b>advertise-default-route</b>	<p>Optional. Determines whether RIP should advertise the default route. Supported values are as follows:</p> <p><b>true:</b> Advertise the default route.</p> <p><b>false:</b> Do not advertise the default route.</p> <p>The default is <b>true</b>.</p>
<b>route-timeout</b>	<p>Optional. Sets the route expiry interval. If no periodic or triggered update of a route from this neighbor has been received within this time interval, the route is considered to have expired.</p> <p>The range is 1 to 4294967296. The default is 180 seconds, which should not normally need to be changed.</p>

---

<b>route-expiry-secs</b>	<p>Optional. Determines how long the router maintains expired routes after their metric has reached infinity. After a route has expired (that is, after the route has been assigned an infinite metric), the router must keep a copy of it for a certain time so it can be reasonably confident it has told its neighbors that the route has expired.</p> <p>The range is 1 to 4294967296. The default is 120 seconds, which should not normally need to be changed.</p>
<b>deletion-delay</b>	<p>The delay, in seconds, before an expired route is deleted from the routing information base.</p> <p>The range is 1 to 4294967296. The default is 120.</p>
<b>triggered-delay</b>	<p>Optional. Sets the interval, in seconds, for the triggered update timer.</p> <p>When a router receives a modified route from a neighbor, it does not have to wait until the next periodic update to tell the other neighbors, but instead sends a triggered update. After a triggered update is sent, a timer is set for a random period in the interval specified by <b>triggered-jitter</b>. If other changes occur that would trigger updates before the timer expires, a single update is triggered when the timer expires.</p> <p>The range is 1 to 4294967296. The default is 3.</p>
<b>triggered-jitter</b>	<p>Optional. Sets the interval, in seconds, from within which the triggered update timer will randomly select an interval for triggered updates.</p> <p>The range is 0 to 100, where zero means use no random jitter (that is, always use the time specified in <b>triggered-delay</b>). The default is 66.</p>
<b>update-interval</b>	<p>Optional. The interval, in seconds, of routing updates.</p> <p>A RIP router will typically tell its neighbors its entire routing table every 30 seconds. To avoid self-synchronization of routing updates, the precise time interval between telling each neighbor about routing updates is randomly jittered, with the delay chosen in the interval specified by <b>update-jitter</b>.</p> <p>The range is 1 to 4294967296. The default is 30.</p>

<b>update-jitter</b>	<p>Optional. Sets the interval, in seconds, from within which the update timer will randomly select an interval for routing updates.</p> <p>The range is 0 to 100, where 0 means use no random jitter (that is, always use the time specified in <b>update-interval</b>). The default is 35.</p>
<b>request-interval</b>	<p>Optional. Determines how often a route update request may be sent.</p> <p>When a RIP router has no neighbors on a address, it may periodically send a request for a route update in case a neighbor appears. This timer determines how often such a request is re-sent.</p> <p>The range is 1 to 10000, and 0, which disables route update requests. The default is 30 seconds.</p>
<b>interpacket-delay</b>	<p>Optional. The default delay, in milliseconds, between back-to-back RIP packets when an update is sent that requires multiple packets to be sent.</p> <p>The range is 1 to 4294967296. The default is 50.</p>
<b>authentication</b>	<p>Optional. The authentication mechanism used to authorize RIP updates sent and received via this address.</p>
<b>simple-password</b>	<p>Optional. The password to be used for plaintext authentication on this address.</p> <p>The default is an empty string.</p>
<b>md5</b>	<p>Multi-node. An integer specifying the MD5 authentication key. The range is 0 to 255.</p> <p>You can define more than one MD5 authentication key by creating multiple <b>md5</b> configuration nodes.</p>
<b>password</b>	<p>The password to be used for this MD5 authentication key.</p>
<b>start-time</b>	<p>The start time of the interval when this authentication key and password will be valid. The format is <i>YYYY-MM-DD.HH:MM</i>.</p>
<b>end-time</b>	<p>The end time of the interval when this authentication key and password will be valid. The format is <i>YYYY-MM-DD.HH:MM</i>.</p>

---

<b>import</b>	<p>Optional. A RIP import policy defined using the <b>policy</b> statement. The import policy will be used to evaluate routing updates received by RIP. For policy terms that match, the defined action will be taken.</p> <p>Multiple policies can be configured using a comma-separated list of policy names.</p>
<b>export</b>	<p>Optional. A RIP export policy defined using the <b>policy</b> statement. The import policy will be used to evaluate routing updates sent to neighbors. For policy terms that match, the defined action will be taken.</p> <p>Multiple policies can be configured using a comma-separated list of policy names.</p>

---

### Usage Guidelines

Use this command to configure RIP for IPv6 on the router. You can also Use this command to announce routes.

To announce routes, you export the routes that are to be announced, using the export parameter. You can export routes on directly connected networks or static routes using the **export** *policy-name* directive.

D R A F T

## show rip peer

Displays information for the RIP peers of this router.

---

### Command Mode

Operational mode.

---

### Syntax

```
show rip peer [statistics [ipv4 | ipv6 | all]]
```

---

### Parameters

<i>ipv4</i>	Displays peer statistics for the specified IPv4 address.
<i>ipv6</i>	Displays peer statistics for the specified IPv6 address.
<b>all</b>	Displays peer statistics for all RIP interfaces on the router.

---

### Usage Guidelines

Use this command to display information about RIP peers.

**D R A F T**

## show rip statistics

Displays RIP statistics.

---

### Command Mode

Operational mode.

---

### Syntax

```
show rip statistics [ipv4 | ipv6 | all]
```

---

### Parameters

<i>ipv4</i>	Displays RIP statistics for the specified IPv4 address.
<i>ipv6</i>	Displays RIP statistics for the specified IPv6 address.
<b>all</b>	Displays statistics for all RIP interfaces on the router.

---

### Usage Guidelines

Use this command to display RIP statistics for interfaces configured for RIP.

**D R A F T**

## show rip status

Displays RIP status.

---

### Command Mode

Operational mode.

---

### Syntax

```
show rip status [ ipv4 | ipv6 | all ]
```

---

### Parameters

<i>ipv4</i>	Displays RIP status for the specified IPv4 address.
<i>ipv6</i>	Displays RIP status for the specified IPv6 address.
<b>all</b>	Displays status for all RIP interfaces on the router.

---

### Usage Guidelines

Use this command to see the status of RIP on the router.

**D R A F T**

## Chapter 9: OSPF

This chapter lists the commands for configuring OSPF on the router.

This chapter contains the following commands.

Command	Mode	Description
<code>protocols ospf4</code>	Configuration	Configures OSPF on the router.
<code>show ospf4 database</code>	Operational	Displays the OSPF LSA database.
<code>show ospf4 database area</code>	Operational	Displays the OSPF LSA database for the specified area.
<code>show ospf4 database summary</code>	Operational	Displays summary output for the OSPF LSA database.
<code>show ospf4 database summary area</code>	Operational	Displays summary output for the specified area in the OSPF LSA database.
<code>show ospf4 neighbor</code>	Operational	Displays information about OSPF neighbors of this router.

*See also* the following commands in other chapters.

<code>policy as-path-list</code>	Configuration	Allows you to create a list of AS paths, which can be referenced in BGP policy statements. <i>See page 278.</i>
<code>show route</code>	Operational	Displays information about routes stored in the routing table. <i>See page 155.</i>

# protocols ospf4

Configures OSPF on the router.

---

## Command Mode

Configuration mode.

---

## Syntax

- `set protocols ospf4 ...` Use **set** to create the **ospf** configuration node, or to modify OSPF configuration.
- Note that you cannot use **set** to change the identifier of a configuration node. To change this information, delete the old node and create a new configuration node with the correct information.
- `delete protocols ospf4 ...` Use **delete** to delete the **ospf** configuration node altogether, or to delete one of its subordinate nodes.

---

## Configuration Statement

```
protocols {
  ospf4 {
    router-id: ipv4
    rfc1583-compatibility: [true|false]
    ip-router-alert: [true|false]
    traceoptions {
      flag {
        all {
          disable:[true|false]
        }
      }
    }
    area: ipv4 {
      area-type:[normal|stub|nssa]
      default-lsa {
        disable:[true|false]
        metric: 1-4294967296
      }
      summaries {
        disable:[true|false]
      }
      area-range: ipv4net {
        advertise:[true|false]
      }
    }
  }
}
```

```

    }
    virtual-link: ipv4 {
        transit-area: ipv4
        hello-interval: 1-65535
        router-dead-interval: 1-4294967295
        retransmit-interval: 1-65535
        transit-delay: 0-3600
        authentication {
            simple-password: text
            md5: 0-255 {
                password: text
                start-time: YYYY-MM-DD.HH:MM
                end-time: YYYY-MM-DD.HH:MM
                max-time-drift: 0-65534,65535
            }
        }
    }
}
interface: text {
    link-type: [broadcast|p2p|p2m]
    address: ipv4 {
        priority: 0-255
        hello-interval: 1-65535
        router-dead-interval: 1-4294967296
        interface-cost: 1-65535
        retransmit-interval: 1-65535
        transit-delay: 0-3600
        authentication {
            simple-password: text
            md5: 0-255 {
                password: text
                start-time: YYYY-MM-DD.HH:MM
                end-time: YYYY-MM-DD.HH:MM
                max-time-drift: 0-65534,65535
            }
        }
        passive: [true|false]
        neighbor: ipv4 {
            router-id: ipv4
        }
        disable: [true|false]
    }
}
import: text
export: text
}

```

---

## Parameters

<b>router-id</b>	<p>Mandatory. The identifier of this router. This is a unique 32-bit number in IP address format that is assigned to each router running the OSPF protocol. This number uniquely identifies this router within the OSPF domain.</p> <p>It is good practice to set the OSPF router ID to the address of the loopback interface, since the loopback interface is the most reliable interface on the router.</p>
<b>rfc1583-compatibility</b>	<p>Indicates whether handling of AS external routes should comply with RFC 1583. Supported values are as follows:</p> <p><b>true</b>: Comply with RFC 1583.</p> <p><b>false</b>: Do not comply with RFC 1583.</p> <p>The default is <b>false</b>.</p>
<b>ip-router-alert</b>	<p>Optional. Indicates whether to send the IP router alert option in packets. Supported values are as follows:</p> <p><b>true</b>: Send the IP router alert option in packets.</p> <p><b>false</b>: Do not send the IP router alert option in packets.</p> <p>The default is <b>false</b>.</p>
<b>traceoptions</b>	Sets the tracing and debugging options for OSPF.
<b>flag</b>	Specifies which tracing options are enabled.
<b>all</b>	Enables or disables all tracing options.
<b>disable</b>	<p>Optional. Enables or disables debugging output for OSPF. Supported values are as follows:</p> <p><b>true</b>: Disables debugging output for OSPF.</p> <p><b>false</b>: Enables debugging output for OSPF.</p> <p>The default is <b>false</b>.</p>
<b>area</b>	<p>Mandatory. Multi-node. An IPv4 address uniquely identifying the OSPF area with which you want to associate the attached network.</p> <p>To configure the router as an Area Border Router, associate the router with more than one area by issuing this statement multiple times.</p>

---

<b>area-type</b>	<p>Mandatory. The type of the area. Supported values are as follows:</p> <p><b>normal:</b> This is a normal OSPF area: one that is neither a stub area nor a not-so-stubby area.</p> <p><b>stub:</b> This is a stub area: one where no external link-state advertisements (type 5 LSAs) are allowed. Any routers in a stub area must be configured with this option.</p> <p><b>nssa:</b> This is a not-so-stubby area (NSSA): one where type 3 and 4 summary link-state advertisements (LSAs) are prevented from being sent into the specified area. In an NSSA, no inter-area routes are allowed.</p> <p>The default is <b>normal</b>.</p>
<b>default-lsa</b>	Specifies characteristics of the default route.
<b>disable</b>	<p>Enables and disables originating the default route in stubby or not-so-stubby areas. Supported values are as follows:</p> <p><b>true:</b> Allow the default route to originate in stubby or not-so-stubby areas.</p> <p><b>false:</b> Do not allow the default route to originate in stubby or not-so-stubby areas.</p> <p>The default is <b>true</b>.</p>
<b>metric</b>	Provides the metric for the default route. The range is 0 to 4294967295. The default is 0.
<b>summaries</b>	Specifies whether route summaries should be generated into stubby and not-so-stubby areas.
<b>disable</b>	<p>Enables and disables route summary generation into stubby and not-so-stubby areas.</p> <p><b>true:</b> Do not generate summaries into stubby and not-so-stubby areas.</p> <p><b>false:</b> Generate summaries into stubby and not-so-stubby areas.</p> <p>The default is <b>false</b>.</p>
<b>area-range</b>	<p>Optional. Multi-node The network for generating route summaries.</p> <p><b>Area Border Routers only.</b> For an area, summarize a range of IP addresses when sending summary link advertisements into other areas. To summarize multiple ranges, include multiple area-range statements.</p>

---

	<p><b>NSSAs.</b> Generate AS-External (Type 5) LSAs into other areas. The specified prefixes are used to aggregate external routes learned within the area when the routes are advertised to other areas. To specify multiple prefixes, include multiple <b>area-range</b> statements. All external routes learned within the area that do not fall into one of the prefixes are advertised individually to other areas.</p> <p>By default, Area Border Routers do not summarize routes being sent from one area to other areas, but rather send all routes explicitly.</p> <p>The format is <i>ipv4/prefix</i>.</p> <p>You can define multiple area ranges by creating multiple <b>area-range</b> configuration nodes.</p>
<b>advertise</b>	<p>Mandatory. Indicates whether to advertise type 3 summary link-state advertisements (LSAs).</p> <p><b>true:</b> Causes the area to generate type 3 summary link-state advertisements (LSAs).</p> <p><b>false:</b> Causes the area to suppress type 3 summary LSAs, hiding the area's component networks from other networks. This effectively creates a route filter.</p> <p>The default is <b>true</b>.</p>
<b>virtual-link</b>	<p>Multi-node. The IP address of the router in the backbone area that you are creating the virtual link to. This router becomes the virtual link neighbor.</p> <p>You can define multiple virtual links by creating multiple <b>virtual-link</b> configuration nodes.</p>
<b>transit-area</b>	<p>Optional. The area through which the virtual link will transit. The format is a 32-bit area identifier.</p>
<b>hello-interval</b>	<p>Optional. Specifies the interval in seconds between hello packets sent over the virtual link. The range is 1 to 65535. The default is 10.</p>
<b>router-dead-interval</b>	<p>Optional. Specifies the time in seconds that neighboring routers will wait to detect hello packets from the virtual link before declaring the router down. The range is 1 to 4294967295 seconds. The default is 40 (four times the hello interval).</p>

---

<b>retransmit-interval</b>	Optional. Specifies the time in seconds to wait for an acknowledgement, after which the router retransmits an LSA packet to its neighbors. The range is 1 to 65535. The default is 5.
<b>transit-delay</b>	Optional. The interface transit delay, in seconds. Indicates the estimated time in seconds required to send a link-state advertisement on this interface. The range is 0 to 3600. The default is 1.
<b>authentication</b>	Optional. The authentication mechanism used to authorize OSPF updates sent from this address.
<b>simple-password</b>	Optional. The password to be used for plaintext authentication on this address.  The default is an empty string.
<b>md5</b>	Multi-node. An integer specifying the MD5 authentication key. The range is 0 to 255.  You can define more than one MD5 authentication key by creating multiple <b>md5</b> configuration nodes.
<b>password</b>	The password to be used for this MD5 authentication key.
<b>start-time</b>	The start time of the interval when this authentication key and password will be valid. The format is <i>YYYY-MM-DD.HH:MM</i> .
<b>end-time</b>	The end time of the interval when this authentication key and password will be valid. The format is <i>YYYY-MM-DD.HH:MM</i> .
<b>max-time-drift</b>	Sets the maximum time drift, in seconds, among all routers. The range is 0 to 65535, where 65535 means unlimited time drift is allowed.
<b>interface</b>	Mandatory. Multi-node. Enables OSPF hellos on the specified interface and attempts to discover OSPF neighbors.  You can enable OSPF on multiple interfaces by creating multiple <b>interface</b> nodes.  You can enable OSPF on an individual vif, rather than an entire interface. To do this, refer to the vif using <i>int.vif</i> notation. For example to refer to vif 40 on interface eth0, use <b>eth0.40</b> .

<b>link-type</b>	<p>Mandatory. Specifies the correct interface type for this physical interface. The following values are supported:</p> <p><b>broadcast</b>: This is an interface that supports broadcast mode (such as a LAN link).</p> <p><b>p2p</b>: This is an interface that supports point-to-point mode (such as a PPP interface or a point-to-point logical interface on Frame Relay).</p> <p><b>p2m</b>: This is an interface that supports point-to-multipoint mode (such as an NBMA interface).</p> <p>The default is broadcast.</p>
<b>address</b>	<p>Mandatory. Multi-node. Configures an IP address on this interface for use with OSPF traffic.</p> <p>You can define multiple OSPF-enabled addresses on an interface by creating multiple <b>address</b> nodes. The IP address must have already been configured on a created network interface.</p>
<b>priority</b>	<p>Optional. Sets the OSPF router priority for this address. The OSPF priority is used in determining whether the router becomes the designated router for this network.</p> <p>If all routers have the same priority, the first router activated on the network becomes the DR and the second router activated on the network becomes the BDR.</p> <p>The range is 0 to 255, where a router with priority 0 can never become the designated router. The default is 128.</p>
<b>hello-interval</b>	<p>Optional. Specifies the interval in seconds between hello packets sent over the interface you are configuring. The range is 1 to 65535. The default is 10.</p>
<b>router-dead-interval</b>	<p>Optional. Specifies the time in seconds that neighboring routers will wait to detect hello packets from the interface you are configuring before declaring the router down. The range is 1 to 4294967295 seconds. The default is 40 (four times the hello interval).</p>
<b>interface-cost</b>	<p>Optional. The link-state metric (OSPF cost) that you want advertised in the link-state advertisement (LSA) as the cost of sending packets over this interface. The range is 1 to 65535. The default is 1.</p>

<b>retransmit-interval</b>	Optional. Specifies the time in seconds to wait for an acknowledgement, after which the router retransmits an LSA packet to its neighbors. The range is 1 to 65535. The default is 5.
<b>transit-delay</b>	Optional. The interface transit delay, in seconds. Indicates the estimated time in seconds required to send a link-state advertisement on this interface. The range is 0 to 3600. The default is 1.
<b>authentication</b>	Optional. The authentication mechanism used to authorize OSPF updates sent from this address.
<b>simple-password</b>	Optional. The password to be used for plaintext authentication on this address.  The default is an empty string.
<b>md5</b>	Optional. Multi-node. An integer specifying the MD5 authentication key. The range is 0 to 255.  You can define more than one MD5 authentication key by creating multiple <b>md5</b> configuration nodes.
<b>password</b>	Optional. The password to be used for this MD5 authentication key.
<b>start-time</b>	The start time of the interval when this authentication key and password will be valid. The format is <i>YYYY-MM-DD.HH:MM</i> .
<b>end-time</b>	The end time of the interval when this authentication key and password will be valid. The format is <i>YYYY-MM-DD.HH:MM</i> .
<b>max-time-drift</b>	Sets the maximum time drift, in seconds, among all routers. The range is 0 to 65535, where 65535 means unlimited time drift is allowed.
<b>passive</b>	Optional. Sets the address into a loopback state. Supported values are as follows:  <b>true</b> : Set the address into a loopback state. <b>false</b> : Do not set the address into a loopback state.  The default is <b>false</b> .

---

<b>neighbor</b>	<p>Optional. Multi-node. The IP address of a router to be designated as an OSPF neighbor. This value should be configured for nonbroadcast interfaces, which will not send broadcast packets to dynamically discover their neighbors.</p> <p>To specify multiple neighbors, create multiple <b>neighbor</b> configuration nodes.</p>
<b>router-id</b>	<p>Mandatory. The OSPF router ID of the neighbor router. An IPv4 address.</p>
<b>disable</b>	<p>Optional. Enables or disables OSPF on this address. Supported options are as follows:</p> <p><b>true</b>: Disables OSPF on this address, without discarding configuration.</p> <p><b>false</b>: Enables OSPF on this address.</p> <p>The default is <b>false</b>.</p>
<b>import</b>	<p>Optional. The name of a routing policy defined using the <b>policy</b> statement. A routing policy that is applied to OSPF as an import will be used to evaluate all routing updates that OSPF receives from its neighbors. Routes that match the routing policy will have the specified action taken; this can include <b>reject</b>, which would block the route from being installed in the routing table.</p> <p>Multiple policies can be configured using a comma-separated list of policy names.</p>
<b>export</b>	<p>Optional. The name of a routing policy defined using the <b>policy</b> statement. A routing policy that is configured as an export in OSPF will evaluate policy criteria for routing updates sent by this router to its OSPF neighbors. This could include exporting routes from other protocols, like static, into the OSPF routing updates.</p> <p>Multiple policies can be configured using a comma-separated list of policy names.</p>

---

---

## Usage Guidelines

Use this command to configure OSPF on the router.

## show ospf4 database

Displays the OSPF LSA database.

---

### Command Mode

Operational mode.

---

### Syntax

```
show ospf4 database [router | network | netsummary | asbrsummary |  
external | nssa] [brief | detail]
```

---

### Parameters

<b>router</b>	Shows router (Type 1) LSAs in the LSA database.
<b>network</b>	Shows network (Type 2) LSAs in the LSA database.
<b>netsummary</b>	Shows network summary (Type 3) LSAs in the LSA database.
<b>asbrsummary</b>	Shows ASBR-summary (Type 4) LSAs in the LSA database.
<b>external</b>	Shows AS-external (Type 5) LSAs in the LSA database.
<b>nssa</b>	Shows NSSA (Type 7) LSAs in the LSA database.
<b>brief</b>	Displays brief output.
<b>detail</b>	Displays detailed output.

---

### Usage Guidelines

Use this command to view the contents of the OSPF LSA database.

Only one option can be specified at a time.

# show ospf4 database area

Displays the OSPF LSA database for the specified area.

---

## Command Mode

Operational mode.

---

## Syntax

```
show ospf4 database area area-id [router | network | netsummary |  
asbrsummary | external | nssa] [brief | detail]
```

---

## Parameters

<i>area-id</i>	The ID of the area for which you want to view LSA information.
<b>router</b>	Shows router (Type 1) LSAs for the specified area.
<b>network</b>	Shows network (Type 2) LSAs for the specified area.
<b>netsummary</b>	Shows network summary (Type 3) LSAs for the specified area.
<b>asbrsummary</b>	Shows ASBR-summary (Type 4) LSAs for the specified area.
<b>external</b>	Shows AS-external (Type 5) LSAs for the specified area.
<b>nssa</b>	Shows NSSA (Type 7) LSAs for the specified area.
<b>brief</b>	Displays brief output.
<b>detail</b>	Displays detailed output.

---

## Usage Guidelines

Use this command to see the contents of the OSPF LSA database for a specified area.

Only one option can be specified at a time.

## show ospf4 database summary

Displays summary output for the OSPF LSA database.

---

### Command Mode

Operational mode.

---

### Syntax

```
show ospf4 database summary [router | network | netsummary |  
                             asbrsummary | external | nssa] [brief | detail]
```

---

### Parameters

<b>router</b>	Shows summary output for router (Type 1) LSAs in the LSA database.
<b>network</b>	Shows summary output for network (Type 2) LSAs in the LSA database.
<b>netsummary</b>	Shows summary output for network summary (Type 3) LSAs in the LSA database.
<b>asbrsummary</b>	Shows summary output for ASBR-summary (Type 4) LSAs in the LSA database.
<b>external</b>	Shows summary output for AS-external (Type 5) LSAs in the LSA database.
<b>nssa</b>	Shows summary output for NSSA (Type 7) LSAs in the LSA database.
<b>brief</b>	Displays brief output.
<b>detail</b>	Displays detailed output.

---

### Usage Guidelines

Use this command to see summary output for the OSPF LSA database.

Only one option can be specified at a time.

# show ospf4 database summary area

Displays summary output for the specified area in the OSPF LSA database.

---

## Command Mode

Operational mode.

---

## Syntax

```
show ospf4 database summary area area-id [router | network |  
      netsummary | asbrsummary | external | nssa] [brief | detail]
```

---

## Parameters

<i>area-id</i>	The ID of the area for which you want to view LSA information.
<b>router</b>	Shows summary output for router (Type 1) LSAs for the specified area.
<b>network</b>	Shows summary output for network (Type 2) LSAs for the specified area.
<b>netsummary</b>	Shows summary output for network summary (Type 3) LSAs for the specified area.
<b>asbrsummary</b>	Shows summary output for ASBR-summary (Type 4) LSAs for the specified area.
<b>external</b>	Shows summary output for AS-external (Type 5) LSAs for the specified area.
<b>nssa</b>	Shows summary output for NSSA (Type 7) LSAs for the specified area.
<b>brief</b>	Displays brief output.
<b>detail</b>	Displays detailed output.

---

## Usage Guidelines

Use this command to see summary output for the specified area in the OSPF LSA database. Only one option can be specified at a time.

# show ospf4 neighbor

Displays information about OSPF neighbors of this router.

---

## Command Mode

Operational mode.

---

## Syntax

```
show ospf4 neighbor neighbor [brief | detail]
```

---

## Parameters

<i>neighbor</i>	Displays information about the specified neighbor.
<b>brief</b>	Displays brief output.
<b>detail</b>	Displays detailed output.

---

## Usage Guidelines

Use this command to see information about OSPF neighbors to this router.

When used without specifying a neighbor, information is shown for all neighbors to this router. When a neighbor is specified, information is shown for just the specified neighbor.

## Chapter 10: BGP

This chapter lists the commands for setting up the Border Gateway Protocol on the Vyatta OFR.

This chapter contains the following commands.

Command	Mode	Description
<code>clear bgp</code>	Operational	Resets BGP peer information.
<code>protocols bgp damping</code>	Configuration	Enables BGP on the router, sets the BGP ID, and sets the AS.
<code>protocols bgp confederation</code>	Configuration	Adds the router to a BGP confederation.
<code>protocols bgp damping</code>	Configuration	Sets the characteristics for route flap damping.
<code>protocols bgp export</code>	Configuration	Applies a pre-configured routing export policy to BGP.
<code>protocols bgp import</code>	Configuration	Applies a pre-configured routing import policy to BGP.
<code>protocols bgp peer</code>	Configuration	Defines an eBGP or iBGP peer.
<code>protocols bgp route-reflector</code>	Configuration	Allows you to designate this router as a BGP route reflector.
<code>protocols bgp traceoptions</code>	Configuration	Allows you to specify settings for BGP messages sent to syslog.
<code>show bgp peers</code>	Operational	Displays information about BGP peerings.
<code>show bgp routes</code>	Operational	Displays BGP route information.

*See also* the following commands in other chapters.

<code>policy as-path-list</code>	Configuration	Allows you to create a list of AS paths, which can be referenced in BGP policy statements. <i>See page 278.</i>
<code>show route</code>	Operational	Displays information about routes stored in the routing table. <i>See page 155.</i>

# clear bgp

Resets BGP peer information.

---

## Command Mode

Operational mode.

---

## Syntax

```
clear bgp [ipv4 | as]
```

---

## Parameters

<i>ipv4</i>	Resets peer information for the peer at the specified IP address.
<i>as</i>	Resets all BGP peers within the specified autonomous system.

---

## Usage Guidelines

Use this command on a router running BGP to reset information for BGP peers.

## protocols bgp

Enables BGP on the router, sets the BGP ID, and sets the AS.

---

### Command Mode

Configuration mode.

---

### Syntax

<code>set protocols bgp ...</code>	Use <b>set</b> to create the <b>bgp</b> configuration node, or to modify BGP configuration.  Note that you cannot use <b>set</b> to change the identifier of a configuration node. In BGP, this includes peer identifiers, as well as the network address identifying an originated route. To change this information, delete the old node and create a new configuration node with the correct information.
<code>delete protocols bgp ...</code>	Use <b>delete</b> to delete the <b>bgp</b> configuration node altogether, or to delete one of its subordinate nodes.

---

### Configuration Statement

```
protocols {  
    bgp {  
        bgp-id: ipv4  
        local-as: 1-65535  
    }  
}
```

---

### Parameters

---

<b>bgp-id</b>	Mandatory. The BGP identifier for this router.  The required format of the BGP ID is a dotted-decimal IPv4 address, as mandated by the BGP specification.
<b>local-as</b>	Mandatory. The autonomous system number for the domain in which this router resides.  Any peers of this router must be configured to know this AS number—if there is a mismatch, a peering will not be established. The range is 1 to 65535.

---

---

## Usage Guidelines

Use this command to enable BGP on the router, and set its BGP ID and its autonomous system.

The BGP ID is normally given the loopback address of the router. Note that the BGP ID does not actually provide any reachability information, but just gives the BGP speaker a unique identifier.

Even so, it is typically set to one of the router's IP addresses, and it is normally required that this be globally unique. It is considered good practice to set the BGP router ID to the address of the loopback interface, as this is the most reliable interface on the router.

# protocols bgp confederation

Adds the router to a BGP confederation.

---

## Command Mode

Configuration mode.

---

## Syntax

```
set protocols bgp  
  confederation ...
```

Use **set** to create the **confederation** configuration node, to modify the confederation identifier, or disable membership in a confederation.

```
delete protocols bgp  
  confederation ...
```

Use **delete** to delete the BGP confederation altogether, or to delete the **disable** attribute.

Note that you will not be able to delete the identifier attribute, which is mandatory. If you delete the disable attribute, the setting of that attribute will revert to the default.

---

## Configuration Statement

```
protocols {  
  bgp {  
    confederation {  
      identifier: 1-4294967296  
      disable: [true|false]  
    }  
  }  
}
```

---

## Parameters

---

<b>confederation</b>	Optional. Makes this router part of a confederation.
----------------------	--

---

<b>identifier</b>	Mandatory. The confederation to which this router will belong.
-------------------	--

---

---

<b>disable</b>	Optional. Enables or disables this router's membership in the confederation. Supported values are as follows:  <b>true</b> : Disables this router's membership in the confederation, without discarding configuration.  <b>false</b> : Enables this router's membership in the confederation.  The default is <b>false</b> .
----------------	--

---

---

## Usage Guidelines

Use this command to add this router to a BGP confederation.

Confederations enable you to reduce the size and complexity of the iBGP mesh. In a BGP confederation, a single AS is divided into multiple internal sub-ASs. The sub-ASs are grouped as a confederation, which advertises as a single AS to external peers.

The sub-ASs are only visible within the defined confederation. From outside the confederation, they appear as a single AS. The sub-ASs exchange routing information as if they are iBGP peers.

Sub-ASs use different BGP AS numbers and connections between sub-ASs are eBGP connections. The system is configured to know that the eBGP is another confederation within the same AS, as true eBGP neighbors are identified differently.

.

# protocols bgp damping

Sets the characteristics for route flap damping.

---

## Command Mode

Configuration mode.

---

## Syntax

- `set protocols bgp damping ...` Use **set** to initially configure route flap damping, or to change settings for route flap damping.
- `delete protocols bgp damping ...` Use **delete** to delete the **damping** configuration node altogether, or to delete one of its attributes.
- If you delete one of the optional attributes, the setting for that attribute will revert to the default.

---

## Configuration Statement

```
protocols {
  bgp {
    damping {
      half-life: 1-4294967296
      max-suppress: 1-4294967296
      reuse: 1-4294967296
      suppress: 1-4294967296
      disable: [true|false]
    }
  }
}
```

---

## Parameters

---

<b>damping</b>	Optional. Configures route flap damping.
<b>half-life</b>	Optional. The time in minutes after which the flapping penalty is decreased.  After a route has been assigned a penalty, the penalty is decreased by half after the half-life period. Subsequently, the penalty is reduced every 5 seconds. The range is 1 to 45. The default is 15.

---

---

<b>max-suppress</b>	Optional. The maximum time in minutes a route can be suppressed. The range is 1 to 20000. The default is 60.
<b>reuse</b>	Optional. The reuse threshold. If the penalty for a flapping route falls below this value, the route is unsuppressed. The range is 1 to 20000. The default is 750.
<b>suppress</b>	Optional. The suppression threshold. A route is suppressed when its penalty exceeds this limit. The range is 1 to 20000. The default is 3000.
<b>disable</b>	Optional. Enables or disables damping. Supported values are as follows: <b>true</b> : Disables damping, without discarding configuration. <b>false</b> : Enables damping. The default is <b>false</b> .

---

---

## Usage Guidelines

Use this command to configure route flap damping.

Route flap is a situation where a route fluctuates repeatedly between being announced, then withdrawn, then announced, then withdrawn, and so on. In this situation, a BGP system will send an excessive number of update messages advertising network reachability information.

Route dampening minimizes the propagation of update messages between BGP peers for flapping routes. This reduces the load on these devices without unduly impacting the route convergence time for stable routes.

When route damping is enabled, a route is assigned a penalty each time it “flaps.” If the penalty exceeds a configured threshold (its *suppress* value) the route is suppressed.

After the route has been stable for a configured interval (its *half-life*) the penalty is reduced by half. Subsequently, the penalty is reduced every 5 seconds. When the penalty falls below a configured value (its *reuse* value), the route is unsuppressed.

The penalty applied to a route will never exceed the *maximum penalty*, which is computed from configured attributes as follows:

$$\text{Maximum penalty} = \text{reuse} * 2^{(\text{suppress} / \text{half-life})}$$

# protocols bgp export

Applies a pre-configured routing export policy to BGP.

---

## Command Mode

Configuration mode.

---

## Syntax

<code>set protocols bgp export policy-name ...</code>	Use <b>set</b> to specify an export policy to be applied to BGP.
<code>delete protocols bgp export policy-name...</code>	Use <b>delete</b> to remove an export policy from BGP.

---

## Configuration Statement

```
protocols {  
    bgp {  
        export: text  
    }  
}
```

---

## Parameters

<b>export</b>	Optional. The name of the export policy you configured for BGP. The export policy will be used to evaluate routing updates being generated by BGP. For policy terms that match, the defined action will be taken.  Multiple policies can be specified using a comma-separated list of policy names.
---------------	---

---

## Usage Guidelines

Use this command to specify export routing policies to be applied to BGP.

# protocols bgp import

Applies a pre-configured routing import policy to BGP.

---

## Command Mode

Configuration mode.

---

## Syntax

<code>set protocols bgp import policy-name ...</code>	Use <b>set</b> to specify an import policy to be applied to BGP.
<code>delete protocols bgp import policy-name...</code>	Use <b>delete</b> to remove an import policy from BGP.

---

## Configuration Statement

```
protocols {  
    bgp {  
        import: text  
    }  
}
```

---

## Parameters

<b>import</b>	Optional. The name of the import policy you configured for BGP. The import policy will be used to evaluate routing updates being received by BGP. For policy terms that match, the defined action will be taken.  Multiple policies can be specified using a comma-separated list of policy names.
---------------	--

---

## Usage Guidelines

Use this command to specify import routing policies to be applied to BGP.

# protocols bgp peer

Defines an eBGP or iBGP peer.

---

## Command Mode

Configuration mode.

---

## Syntax

`set protocols bgp peer ipv4 ...` Use **set** to define a new iBGP or eBGP peer, or to modify a peer's configuration settings.

Note that you cannot use **set** to change the identifier of a peer. In BGP, this includes peer identifiers, as well as the network address identifying an originated route. To change the peer identifier, delete the old node and create a new configuration node with the correct identifier.

`delete protocols bgp peer  
ipv4 ...`

Use **delete** to delete a peer altogether, or to delete one of its attributes.

Note that you cannot delete a mandatory attribute. If you delete an optional attribute that has a default, the settings will revert to the default value.

---

## Configuration Statement

```
protocols {  
  bgp {  
    peer: text {  
      local-ip: ipv4  
      as: 1-65535  
      next-hop: ipv4  
      next-hop6: ipv6  
      holdtime: 0,3-65535  
      delay-open-time: 1-4294967296  
      client: [true|false]  
      confederation-member: [true|false]  
      prefix-limit {  
        maximum: 1-4294967296  
        disable: [true|false]  
      }  
      disable: [true|false]  
      ipv4-unicast: [true|false]
```

```

        ipv4-multicast: [true|false]
        ipv6-unicast: [true|false]
        ipv6-multicast: [true|false]
    }
}

```

## Parameters

<b>peer</b>	<p>Optional. Multi-node. Configures a BGP peering association with another router. The format is the IPv4 unicast address of the router being peered with.</p> <ul style="list-style-type: none"> <li>For eBGP peerings, the peer identifier is normally the IP address of the peer router on the interface over which BGP traffic is to be exchanged.</li> <li>For iBGP peerings, the peer identifier is normally an IP address bound to the peer's loopback interface.</li> </ul> <p>You can define multiple peers for this router by creating multiple <b>peer</b> configuration nodes.</p>
<b>local-ip</b>	Mandatory. The IPv4 address that the remote peer should use for BGP connections to this peer.
<b>as</b>	Mandatory. The AS that the remote peer belongs to. This must be the AS number that the peer advertises for itself, or the peering will not be established. The range is 1 to 65535.
<b>next-hop</b>	Mandatory. The IPv4 address that will be sent as the next-hop router address in routes sent to this peer.
<b>next-hop6</b>	Optional. The IPv6 address that will be sent as the next-hop router address in routes sent to this peer.
<b>holdtime</b>	<p>Optional. The holdtime in seconds that the router should use when negotiating the connection with this peer. If no message is received from a BGP peer during the negotiated holdtime, the peering will be shut down.</p> <p>Supported values are 0 (wait forever), or 3 to 65535. The default is 90.</p>
<b>delay-open-time</b>	Optional. How long in seconds this router should wait before sending an OPEN message to this peer. This allows the remote peer time to send the first OPEN message. The range is 0 to 65535, where 0 means send the OPEN message immediately. The default is 0.

---

<b>client</b>	<p>Optional. Identifies this peer as a client or non-client for of the cluster's route reflector. Supported values are as follows:</p> <p><b>true</b>: The peer is a client of the route reflector.</p> <p><b>false</b>: The peer is a non-client of the route reflector.</p> <p>The default is <b>false</b>.</p>
<b>confederation-member</b>	<p>Optional. Identifies the peer as a member or non-member of the confederation. Supported values are as follows:</p> <p><b>true</b>: This router is a confederation member.</p> <p><b>false</b>: This router is a not a confederation member.</p> <p>The default is <b>false</b>.</p>
<b>prefix-limit</b>	<p>Optional. Provides the ability to disallow a peer if the number of prefixes received from that peer exceeds a threshold.</p>
<b>maximum</b>	<p>The maximum number of prefixes that will be accepted from the peer before disallowing it. The range is 1 to 4294967294. The default is 250000.</p>
<b>disable</b>	<p>Optional. Enables or disables prefix filtering for this peer. Supported values are as follows:</p> <p><b>true</b>: Disables prefix filtering for this peer, without discarding configuration.</p> <p><b>false</b>: Enables prefix filtering for this peer.</p> <p>The default is <b>false</b>.</p>
<b>disable</b>	<p>Optional. Enables or disables this peer. Supported values are as follows:</p> <p><b>true</b>: Disables this peer, without discarding the configuration.</p> <p><b>false</b>: Enables this peer.</p> <p>The default is <b>false</b>.</p>
<b>ipv4-unicast</b>	<p>Optional. Enables or disables BGP negotiation multi-protocol support allowing IPv4 unicast routes to be exchanged. Supported values are as follows:</p> <p><b>true</b>: Allows IPv4 unicast route exchange.</p> <p><b>false</b>: Disallows IPv4 unicast route exchange.</p> <p>The default is <b>true</b>.</p>

---

---

<b>ipv4-multicast</b>	<p>Enables or disables BGP negotiation multi-protocol support allowing IPv4 multicast routes to be exchanged. Supported values are as follows:</p> <p><b>true</b>: Allows IPv4 multicast route exchange.</p> <p><b>false</b>: Disallows IPv4 multicast route exchange.</p> <p>The default is <b>false</b>.</p>
<b>ipv6-unicast</b>	<p>Optional. Enables or disables BGP negotiation multi-protocol support allowing IPv6 unicast routes to be exchanged. Supported values are as follows:</p> <p><b>true</b>: Allows IPv6 unicast route exchange.</p> <p><b>false</b>: Disallows IPv6 unicast route exchange.</p> <p>The default is <b>true</b>.</p>
<b>ipv6-multicast</b>	<p>Enables or disables BGP negotiation multi-protocol support allowing IPv6 multicast routes to be exchanged. Supported values are as follows:</p> <p><b>true</b>: Allows IPv6 multicast route exchange.</p> <p><b>false</b>: Disallows IPv6 multicast route exchange.</p> <p>The default is <b>false</b>.</p>

---

## Usage Guidelines

Use this command to define an iBGP or eBGP peer.

BGP is used in two different ways:

- iBGP is used to exchange routing information between routers that are in the same AS. Typically, these routes are originally learned from eBGP. A peering connection between routers configured in the same AS is an iBGP peering.
- eBGP is used to exchange routing information between routers that are in different ASs. A peering connection between routers that are not configured in the same AS is an eBGP peering.

When a route is learned from another router over an eBGP connection, the router first decides if this is the best path to the destination, based on a standard decision process and local policy configuration. If the route is the best path, the route is passed on to all the other BGP routers in the same domain using iBGP connections, as well as on to all the eBGP peers (as allowed by policy).

For iBGP peerings, the peer identifier is normally the IP address bound to that router's loopback interface. An iBGP session is usually contained within a local LAN, with multiple redundant physical links between the iBGP devices. For iBGP routes, reachability is all that

is necessary, and the loopback interface is reachable so long as at least one physical interface is operational. For this situation, therefore, peering on the loopback interface works well.

Since BGP does not provide reachability information, you must sure that each iBGP peer knows how to reach other peers. To be able to reach one another, each peer must have some sort of Interior Gateway Protocol (IGP) route, such as a connected route, a static route, or a route through a dynamic routing protocol such as RIP or OSPF, which tells them how to reach the opposite router.

eBGP usually takes place over WAN links, where there is a single physical path between eBGP peers. Redundancy is accomplished by using multiple peers over different WAN links with distinct BGP sessions so that, if one session fails, another can take over. For eBGP peerings, therefore, the peer identifier is normally the IP address of the peer router on the physical interface over which BGP traffic is to be exchanged.

## protocols bgp route-reflector

Allows you to designate this router as a BGP route reflector.

---

### Command Mode

Configuration mode.

---

### Syntax

```
set protocols bgp  
  route-reflector ...
```

Use **set** to designate this router as a route reflector, to change the route reflection cluster identifier, or to disable route reflection.

```
delete protocols bgp  
  route-reflector ...
```

Use **delete** to delete a route reflector.

Note that you cannot delete the **cluster-id** attribute, as it is a mandatory attribute. If you delete the **disable** attribute, the setting for that attribute reverts to the default.

---

### Configuration Statement

```
protocols {  
  bgp {  
    route-reflector {  
      cluster-id: ipv4  
      disable: [true|false]  
    }  
  }  
}
```

---

### Parameters

---

<b>route-reflector</b>	Optional. Makes this router a route reflector.
------------------------	--

---

<b>cluster-id</b>	Mandatory. A network address uniquely identifying the route reflection cluster in an internal BGP group.
-------------------	--

---

---

<b>disable</b>	Optional. Enables or disables route reflection for this router. Supported values are as follows:  <b>true</b> : Disables route reflection on this router, without discarding configuration.  <b>false</b> : Enables route reflection on this router.  The default is <b>false</b> .
----------------	---

---

---

## Usage Guidelines

Use this command to designate this router as a route reflector.

In a fully meshed BGP configuration, any route learned from an iBGP peer is not re-advertised to other iBGP peers. In BGP Route Reflection, iBGP re-advertisement restrictions are relaxed. An iBGP router speaker that is configured as a “Route Reflector” (RR) can, under certain conditions, re-advertise routes learned internally to other internal peers. The re-advertised routes are known as “reflected routes”.

In route reflection, internal peers of an RR are categorized into two types:

- Client peers. The RR and its client peers form a cluster. Within a cluster, client peers need not be fully meshed, but must have an iBGP connection to the RR(s) in the cluster. From the client’s perspective these iBGP connections look the same as any other iBGP connection; that is, the client has no awareness that it is in a Route Reflector cluster.
- Non-client peers. Non-client peers, including the RR, must be fully meshed.

When an RR receives a route from an iBGP peer, it selects the best path based on its path selection rule. After the best path is selected, the RR chooses its action depending on the type of the peer from which it learned the best path.

- If the route was learned from a client peer, the RR reflects the route to both client and non-client peers. All iBGP updates from client peers are reflected to all other client peers in the cluster. This is done regardless of whether the update was the best path for the RR itself.
- If the route was learned from a non-client peer, it is reflected out to all client peers.

To prevent looping, clients must not peer with RRs outside of the cluster.

# protocols bgp traceoptions

Allows you to specify settings for BGP messages sent to syslog.

---

## Command Mode

Configuration mode.

---

## Syntax

`set protocols bgp traceoptions ...` Use **set** to create the **traceoptions** configuration node, or to modify traceoptions settings.

`delete protocols bgp traceoptions ...` Use **delete** to delete the **traceoptions** configuration node altogether, or to delete one of its subordinate nodes.

Note that if you delete an optional node that has a default, the default value will be applied.

---

## Configuration Statement

```
protocols {
  bgp {
    traceoptions {
      flag {
        verbose {
          disable: [true|false]
        }
        all {
          disable: [true|false]
        }
        message-in {
          disable: [true|false]
        }
        message-out {
          disable: [true|false]
        }
        state-change {
          disable: [true|false]
        }
        policy-configuration {
          disable: [true|false]
        }
      }
    }
  }
}
```

```

    }
}

```

## Parameters

<b>traceoptions</b>	Optional. Enables or disables tracing (debugging) information for BGP.
<b>flag</b>	Selectively defines the options for which tracing is to be enabled.
<b>verbose</b>	Optional. Allows you to request extra detail in debug messages.
<b>disable</b>	Optional. Enables or disables verbose tracing. Supported values are as follows:  <b>true</b> : Disables verbose tracing, without discarding the configuration. <b>false</b> : Enables verbose tracing. The default is <b>false</b> .
<b>all</b>	Optional. Allows you to apply tracing for all options at once.
<b>disable</b>	Optional. Enables or disables all tracing options at once. Supported values are as follows:  <b>true</b> : Disables all trace options, without discarding the configuration. <b>false</b> : Enables all trace options. The default is <b>false</b> .
<b>message-in</b>	Optional. Allows you to apply tracing to inbound messages only.
<b>disable</b>	Optional. Enables or disables tracing on inbound messages only. Supported values are as follows:  <b>true</b> : Disables tracing on inbound messages, without discarding the configuration. <b>false</b> : Enables tracing on inbound messages. The default is <b>false</b> .
<b>message-out</b>	Optional. Allows you to apply tracing to outbound messages only.
<b>disable</b>	Optional. Enables or disables tracing on outbound messages only. Supported values are as follows:  <b>true</b> : Disables tracing on outbound messages, without discarding the configuration. <b>false</b> : Enables tracing on outbound messages. The default is <b>false</b> .

---

<b>state-change</b>	Optional. Allows you to apply tracing to forwarding state machine (FSM) state change messages only.
---------------------	---

---

<b>disable</b>	Optional. Enables or disables tracing on FSM state-change messages. Supported values are as follows:  <b>true</b> : Disables tracing on FSM state-change messages, without discarding the configuration.  <b>false</b> : Enables tracing on FSM state-change messages.  The default is <b>false</b> .
----------------	---

---

<b>policy-configuration</b>	Optional. Allows you to apply tracing to BGP policy configuration only.
-----------------------------	---

---

<b>disable</b>	Optional. Enables or disables tracing on outbound messages only. Supported values are as follows:  <b>true</b> : Disables tracing on outbound messages only, without discarding the configuration.  <b>false</b> : Enables tracing on outbound messages only.  The default is <b>false</b> .
----------------	--

---

## Usage Guidelines

Use this command to configure BGP logging.

The BGP process generates log messages during operation. You can configure the system to send BGP-specific log messages to syslog, by creating and enabling the **traceoptions** configuration node. The result will depend on how the system syslog is configured.

Keep in mind that in the current implementation, the main syslog file **/var/log/messages** reports only messages of severity **warning** and above, regardless of the severity level configured. If you want to configure a different level of severity for log messages (for example, if you want to see debug messages during troubleshooting), you must configure syslog to send messages into a different file, which you define within syslog.

# show bgp peers

Displays information about BGP peerings.

---

## Command Mode

Operational mode.

---

## Syntax

```
show bgp peers [detail [peer]]
```

---

## Parameters

<b>detail</b>	Displays detailed information for all BGP peers.
<i>peer</i>	Displays detailed information for the specified BGP peer.

---

## Usage Guidelines

Use this command on a router running BGP to display the status of BGP peerings. The information displayed will include information about all BGP peerings that have been configured.

When used without the **detail** option, this command displays a short list that are configured, irrespective of whether the peering is in established state or not. The **detail** parameter provides additional information, either for all peers or for the specified peer.

The output of this command can be piped through another command using the UNIX pipe operator ("|").

---

## Examples

Example 10-1 shows sample output of **show bgp peers** without the detail option.

Example 10-1 "show bgp peers": Displaying a list of BGP peers

---

```
vyatta@vyatta> show bgp peers
Peer 1: local 192.150.187.112/179 remote 69.110.224.158/179
Peer 2: local 192.150.187.112/179 remote 192.150.187.2/179
Peer 3: local 192.150.187.112/179 remote 192.150.187.78/179
Peer 4: local 192.150.187.112/179 remote 192.150.187.79/179
Peer 5: local 192.150.187.112/179 remote 192.150.187.109/179
```

---

# show bgp routes

Displays BGP route information.

---

## Command Mode

Operational mode.

---

## Syntax

```
show bgp routes [ipv4 [summary |
                        detail |
                        unicast [summary | detail] |
                        multicast [summary | detail]]]
[ipv6 [summary |
       detail |
       unicast [summary | detail] |
       multicast [summary | detail]]]
```

---

## Parameters

<b>ipv4</b>	Displays IPv4 BGP route information.
<b>summary</b>	Summarizes the specified IPv4 BGP route information.
<b>detail</b>	Displays detailed IPv4 BGP peers information.
<b>unicast</b>	Displays displays information about IPv4 unicast BGP routes.
<b>summary</b>	Summarizes the specified IPv4 unicast BGP route information.
<b>detail</b>	Displays detailed IPv4 BGP unicast peers information.
<b>multicast</b>	Displays displays information about IPv4 multicast BGP routes.
<b>summary</b>	Summarizes the specified IPv4 multicast BGP route information.
<b>detail</b>	Displays detailed IPv4 BGP multicast peers information.

<b>ipv6</b>	Displays IPv6 BGP route information.
<b>summary</b>	Summarizes the specified IPv6 BGP route information.
<b>detail</b>	Displays detailed IPv6 BGP peers information.
<b>unicast</b>	Displays displays information about IPv6 unicast BGP routes.
<b>summary</b>	Summarizes the specified IPv6 unicast BGP route information.
<b>detail</b>	Displays detailed IPv6 BGP unicast peer information.
<b>multicast</b>	Displays displays information about IPv6 multicast BGP routes.
<b>summary</b>	Summarizes the specified IPv6 multicast BGP route information.
<b>detail</b>	Displays detailed IPv6 BGP multicast peer information.

## Usage Guidelines

Use this command on a router running BGP to display locally configured BGP routes and BGP routes this router has received from its peers.

When used with no option, this command displays all BGP routes with an intermediate amount of detail. The **ipv4** option displays IPv4 routes, and the **ipv6** option displays IPv6 routes.

On a router with a full Internet routing table (in excess of 100,000 routes), this command can produce a large amount of output. (“”), as follows:

```
show bgp routes | match prefix
```

where *prefix* is the route prefix, as in the following example:

```
show bgp routes | match "10.0.0.0"
```

## Chapter 11: IGMP and MLD

This chapter lists the commands for setting up Internet Group Management Protocol and Multicast Listener Discovery protocol on the Vyatta OER.

This chapter contains the following commands.

Command	Mode	Description
<code>protocols igmp</code>	Configuration	Configures IGMP on the router.
<code>protocols mld</code>	Configuration	Configures MLD on the router.
<code>show igmp group</code>	Operational	Displays information about IGMP group membership.
<code>show igmp interface</code>	Operational	Displays information about IGMP interfaces.
<code>show mld group</code>	Operational	Displays information about MLD group membership.
<code>show mld interface</code>	Operational	Displays information about MLD interfaces.

*See also* the following commands in other chapters.

<code>policy as-path-list</code>	Configuration	Allows you to create a list of AS paths, which can be referenced in BGP policy statements. <i>See page 278.</i>
<code>show route</code>	Operational	Displays information about routes stored in the routing table. <i>See page 155.</i>

# protocols igmp

Configures IGMP on the router.

---

## Syntax

<code>set protocols igmp ...</code>	Use <b>set</b> to create the <b>igmp</b> configuration node, or to modify IGMP configuration.  Note that you cannot use <b>set</b> to change the identifier of a configuration node. To change this information, delete the old node and create a new node with the correct information.
<code>delete protocols igmp ...</code>	Use <b>delete</b> to delete the <b>igmp</b> configuration node altogether, or to delete one of its subordinate nodes.

---

## Command Mode

Configuration mode.

---

## Configuration Statement

```
protocols {
  igmp {
    disable:[true|false]
    interface: eth0..eth23 {
      disable:[true|false]
      version:1-3
      enable-ip-router-alert-option-check: [true|false]
      query-interval: 1-1024
      query-last-member-interval: 1-1024
      query-response-interval: 1-1024
      robust-count: 2-10
    }
    traceoptions {
      flag {
        all {
          disable:[true|false]
        }
      }
    }
  }
}
```

---

## Parameters

<b>disable</b>	<p>Enables or disables IGMP on this router. Supported values are as follows:</p> <p><b>true</b>: Disables IGMP, without discarding the configuration.</p> <p><b>false</b>: Enables IGMP.</p> <p>The default is <b>false</b>.</p>
<b>interface</b>	<p>Mandatory. Multi-node. The name of an Ethernet interface to be monitored by IGMP for the presence of multicast receivers. The network interface must already be created and configured.</p> <p>(See Chapter 3: Ethernet Interfaces, VLANs, and Bridging” for information on creating and configuring network interfaces.)</p> <p>You can enable IGMP on more than one interface by creating multiple <b>interface</b> configuration nodes within the <b>igmp</b> node.</p>
<b>disable</b>	<p>Enables or disables IGMP on this interface. Supported values are as follows:</p> <p><b>true</b>: Disables IGMP, without discarding the configuration.</p> <p><b>false</b>: Enables IGMP.</p> <p>The default is <b>false</b>.</p>
<b>version</b>	<p>Specifies which version of IGMP to support. Make sure that the hosts on the network support the same version. Supported values are as follows:</p> <p><b>1</b>: IGMPv1</p> <p><b>2</b>: IGMPv2</p> <p><b>3</b>: IGMPv3</p> <p>The default is <b>2</b>.</p>
<b>enable-ip-router-alert-option-check</b>	<p>Specifies whether to check for the IP Router Alert option in IP packets. The Router Alert option is IP option 20, specified in RFC 2113. It can be used to alert transit routers to more closely examine the contents of an IP packet. Supported values are as follows:</p> <p><b>true</b>: The router will check to see if the IP Router Alert option is flagged.</p> <p><b>false</b>: The router will not check to see if the IP Router Alert option is flagged.</p> <p>The default is <b>false</b>.</p>

<b>query-interval</b>	<p>Directs the router to send IGMP host-query messages at the specified interval.</p> <p>The range is 1 to 1024, in seconds. The default is 125.</p>
<b>query-last-member-interval</b>	<p>The maximum response time, in seconds, to wait for a response to a group-specific query sent in answer to leave-group messages. It is also the interval between group-specific query messages.</p> <p>When the router receives an IGMPv2 leave message or an IGMPv3 state change report, it sends out a query and expects a response within the time specified by this value.</p> <p>Using a lower value enables members to leave groups more quickly.</p>
<b>query-response-interval</b>	<p>The maximum response time, in seconds, to wait for a host to respond to a group membership query. If the responder does not answer within this interval, the router deletes the group.</p> <p>This value can only be configured for IGMPv2 and IGMPv3. It does not apply to IGMPv1.</p> <p>Using a lower value enables members to join and leave groups more quickly.</p>
<b>robust-count</b>	<p>The number of times that the router should resend each IGMP message from this interface.</p> <p>IGMP sends messages over UDP, which is inherently unreliable. To increase reliability, the message can be resent. The higher the robustness count, the higher the reliability for the messages.</p> <p>The range is 2 to 10. The default is 2.</p>
<b>traceoptions</b>	Sets the tracing and debugging options for IGMP.
<b>flag</b>	Specifies which tracing options are enabled.
<b>all</b>	All tracing options.
<b>disable</b>	<p>Enables or disables the specified tracing options. Supported values are as follows:</p> <p><b>true:</b> Disables tracing.</p> <p><b>false:</b> Enables tracing.</p> <p>The default is <b>false</b>.</p>

---

## Usage Guidelines

Use this command to configure IGMP on the router for IPv4 interfaces. To configure this routing type on IPv6 interfaces, use the **protocols mld** command (see page 229).

In the configuration, each interface that is intended to have multicast listeners must be configured separately. The **traceoptions** section is used to explicitly enable log information that can be used for debugging purposes.

# protocols mld

Configures MLD on the router.

## Syntax

<code>set protocols mld ...</code>	Use <b>set</b> to create the <b>mld</b> configuration node, or to modify MLD configuration.  Note that you cannot use <b>set</b> to change the identifier of a configuration node. To change this information, delete the old node and create a new node with the correct information.
<code>delete protocols mld ...</code>	Use <b>delete</b> to delete the <b>mld</b> configuration node altogether, or to delete one of its subordinate nodes.

## Command Mode

Configuration mode.

## Configuration Statement

```

protocols {
  mld {
    disable:[true|false]
    interface: eth0..eth23 {
      vif text {
        disable:[true|false]
        version:1-2
        enable-ip-router-alert-option-check: [true|false]
        query-interval: 1-1024
        query-last-member-interval: 1-1024
        query-response-interval: 1-1024
        robust-count: 2-10
      }
    }
    traceoptions {
      flag {
        all {
          disable:[true|false]
        }
      }
    }
  }
}

```

---

## Parameters

<b>disable</b>	<p>Enables or disables MLD on this router. Supported values are as follows:</p> <p><b>true</b>: Disables MLD, without discarding the configuration.</p> <p><b>false</b>: Enables MLD.</p> <p>The default is <b>false</b>.</p>
<b>interface</b>	<p>Mandatory. Multi-node. The name of an Ethernet interface to be monitored by MLD for the presence of multicast receivers. The network interface must already be created and configured.</p> <p>(See Chapter 3: Ethernet Interfaces, VLANs, and Bridging” for information on creating and configuring network interfaces.)</p> <p>You can enable MLD on more than one interface by creating multiple <b>interface</b> configuration nodes within the <b>igmp</b> node.</p>
<b>vif</b>	<p>Mandatory. Multi-node. The name of a virtual interface to be monitored by MLD for the presence of multicast receivers. The vif must already be created and configured.</p> <p>(See Chapter 3: Ethernet Interfaces, VLANs, and Bridging” for information on creating and configuring network interfaces.)</p> <p>You can enable MLD on more than one vif by creating multiple <b>vif</b> configuration nodes within the <b>igmp interface</b> node.</p>
<b>disable</b>	<p>Enables or disables MLD on this interface. Supported values are as follows:</p> <p><b>true</b>: Disables MLD, without discarding the configuration.</p> <p><b>false</b>: Enables MLD.</p> <p>The default is <b>false</b>.</p>
<b>version</b>	<p>Specifies which version of MLD to support. Make sure that the hosts on the network support the same version. Supported values are as follows:</p> <p><b>1</b>: MLDv1</p> <p><b>2</b>: MLDv2</p> <p>The default is <b>1</b>.</p>

---

<b>enable-ip-router-alert-option-check</b>	<p>Specifies whether to check for the IP Router Alert option in IP packets. The Router Alert option is IP option 20, specified in RFC 2113. It can be used to alert transit routers to more closely examine the contents of an IP packet. Supported values are as follows:</p> <p><b>true:</b> The router will check to see if the IP Router Alert option is flagged.</p> <p><b>false:</b> The router will not check to see if the IP Router Alert option is flagged.</p> <p>The default is <b>false</b>.</p>
<b>query-interval</b>	<p>Directs the router to send MLD host-query messages at the specified interval.</p> <p>The range is 1 to 1024, in seconds. The default is 125.</p>
<b>query-last-member-interval</b>	<p>The maximum response time, in seconds, to wait for a response to a group-specific query sent in answer to leave-group messages. It is also the interval between group-specific query messages.</p> <p>When the router receives a leave message or an state change report, it sends out a query and expects a response within the time specified by this value.</p> <p>Using a lower value enables members to leave groups more quickly.</p>
<b>query-response-interval</b>	<p>The maximum response time, in seconds, to wait for a host to respond to a group membership query. If the responder does not answer within this interval, the router deletes the group.</p> <p>This value can only be configured for IGMPv2 and IGMPv3. It does not apply to IGMPv1.</p> <p>Using a lower value enables members to join and leave groups more quickly.</p>
<b>robust-count</b>	<p>The number of times that the router should resend each IGMP message from this interface.</p> <p>IGMP sends messages over UDP, which is inherently unreliable. To increase reliability, the message can be resent. The higher the robustness count, the higher the reliability for the messages.</p> <p>The range is 2 to 10. The default is 2.</p>
<b>traceoptions</b>	Sets the tracing and debugging options for MLD.
<b>flag</b>	Specifies which tracing options are enabled.
<b>all</b>	All tracing options.

---

<b>disable</b>	Enables or disables the specified tracing options. Supported values are as follows:  <b>true</b> : Disables tracing. <b>false</b> : Enables tracing.  The default is <b>false</b> .
----------------	--

---

---

## Usage Guidelines

Use this command to configure MLD on the router for IPv6 vifs. To configure this routing type on IPv4 interfaces and vifs, use the the **protocols igmp** command (see page 225).

In the configuration, each vif that is intended to have multicast listeners must be configured separately. The **traceoptions** section is used to explicitly enable log information that can be used for debugging purposes.

# show igmp group

Displays information about IGMP group membership.

---

## Command Mode

Operational mode.

---

## Syntax

```
show igmp group
```

---

## Parameters

None.

---

## Usage Guidelines

Use this command to view information about IGMP group membership.

The information displayed includes the following:

- **Source.** This is the multicast source address in the case of source-specific IGMP Join entries. Alternatively, this is set to **0.0.0.0** in case of any-source IGMP join entries.
- **LastReported.** This contains the address of the most recent receiver that responded to an IGMP Join message.
- **Timeout.** This field shows the number of seconds until the next time the router will query for host members (that is, before the router will send an IGMP Query message for this particular entry).
- **Version.** The version of IGMP being used.
- **State.** The state of the interface.

# show igmp interface

Displays information about IGMP interfaces.

---

## Command Mode

Operational mode.

---

## Syntax

```
show igmp interface [address]
```

---

## Parameters

---

<b>address</b>	Displays IP address information for IGMP interfaces.
----------------	--

---

---

## Usage Guidelines

Use this command to view information about IGMP interfaces.

- When used with no option, this command displays the state of the interface, the querier for the interface, the timeout value, the IGMP version being used, and the number of groups listening.
- When used with the **address** option, the command displays the primary and secondary (if any) addresses enabled for IGMP.

# show mld group

Displays information about MLD group membership.

---

## Command Mode

Operational mode.

---

## Syntax

```
show mld group
```

---

## Parameters

None.

---

## Usage Guidelines

Use this command to view information about MLD group membership.

The information displayed includes the following:

- **Source.** This is the multicast source address in the case of source-specific MLD Join entries. Alternatively, this is set to **0.0.0.0** in case of any-source MLD Join entries.
- **LastReported.** This contains the address of the most recent receiver that responded to an MLD Join message.
- **Timeout.** This field shows the number of seconds until the next time the router will query for host members (that is, before the router will send an MLD Query message for this particular entry).
- **Version.** The version of MLD being used.
- **State.** The state of the interface.

## show mld interface

Displays information about MLD interfaces.

---

### Command Mode

Operational mode.

---

### Syntax

```
show mld interface [address]
```

---

### Parameters

<b>address</b>	Displays IP address information for MLD interfaces.
----------------	---

---

### Usage Guidelines

Use this command to view information about MLD interfaces.

- When used with no option, this command displays the state of the interface, the querier for the interface, the timeout value, the MLD version being used, and the number of groups listening.
- When used with the **address** option, the command displays the primary and secondary (if any) addresses enabled for MLD.

## Chapter 12: PIM Sparse-Mode

This chapter lists the commands for setting up Protocol Independent Multicast on the Vyatta OFR.

This chapter contains the following commands.

Command	Mode	Description
<code>protocols pimsm4</code>	Configuration	Allows you to configure PIM-SM for IPv4 on the router.
<code>protocols pimsm6</code>	Configuration	Allows you to configure PIM-SM for IPv6 on the router.
<code>show pim bootstrap</code>	Operational	Displays information about the IPv4 bootstrap zones that are currently in use.
<code>show pim bootstrap rps</code>	Operational	Displays information about IPv4 Candidate RP information received by the bootstrap mechanism.
<code>show pim interface address</code>	Operational	Displays information about IPv4 PIM-SM network interfaces.
<code>show pim interface address</code>	Operational	Displays address information about IPv4 PIM-SM network interfaces.
<code>show pim join</code>	Operational	Displays information about IPv4 PIM-SM multicast routing state.
<code>show pim mfc</code>	Operational	Displays information about IPv4 PIM multicast forwarding entries installed in the MFEA.
<code>show pim mrib</code>	Operational	Displays information about the MRIB used by IPv4 PIM.
<code>show pim neighbors</code>	Operational	Displays information about this router's IPv4 PIM neighbor routers.
<code>show pim rps</code>	Operational	Displays information about the Candidate RP set for IPv4 PIM-SM.
<code>show pim scope</code>	Operational	Displays information about the IPv4 PIM scope zones for this router.
<code>show pim6 bootstrap</code>	Operational	Displays information about the IPv6 bootstrap zones that are currently in use.
<code>show pim6 bootstrap rps</code>	Operational	Displays information about IPv6 Candidate RP information received by the bootstrap mechanism.
<code>show pim6 interface</code>	Operational	Displays information about IPv6 PIM-SM network interfaces.

Command	Mode	Description
<code>show pim6 interface address</code>	Operational	Displays address information about IPv6 PIM-SM network interfaces.
<code>show pim6 join</code>	Operational	Displays information about IPv6 PIM-SM multicast routing state.
<code>show pim6 mfc</code>	Operational	Displays information about IPv6 PIM multicast forwarding entries installed in the MFEA.
<code>show pim6 mrib</code>	Operational	Displays information about the MRIB used by IPv6 PIM.
<code>show pim6 neighbors</code>	Operational	Displays information about this router's IPv6 PIM neighbor routers.
<code>show pim6 rps</code>	Operational	Displays information about the Candidate RP set for IPv6 PIM-SM.
<code>show pim6 scope</code>	Operational	Displays information about the IPv6 PIM scope zones for this router.

*See also* the following commands in other chapters.

<code>show route</code>	Operational	Displays information about routes stored in the routing table. <i>See page 155.</i>
-------------------------	-------------	---

# protocols pimsm4

Allows you to configure PIM-SM for IPv4 on the router.

## Syntax

<code>set protocols pimsm4 ...</code>	Use <b>set</b> to create the <b>pimsm4</b> configuration node, or to modify PIM-SM configuration.  Note that you cannot use <b>set</b> to change the identifier of a configuration node. To change this information, delete the old node and create a new node with the correct information.
<code>delete protocols pimsm4 ...</code>	Use <b>delete</b> to delete the <b>pimsm4</b> configuration node altogether, or to delete one of its subordinate nodes.

## Command Mode

Configuration mode.

## Configuration Statement

```
protocols {
  pimsm4 {
    disable:[true|false]
    interface eth0..eth23 {
      disable: [true|false]
      enable-ip-router-alert-option-check: [true|false]
      dr-priority: 1-255
      hello-period: 1-18724
      hello-triggered-delay: 1-255
      alternative-subnet ipv4net {}
    }
    static-rps {
      rp ipv4 {
        group-prefix ipv4net {
          rp-priority: 0-255
          hash-mask-len: 4-32
        }
      }
    }
    bootstrap {
      disable: [true|false]
      cand-bsr {
        scope-zone ipv4net{
```

```

        is-scope-zone: [true|false]
        cand-bsr-by-vif-name: 1-4096
        cand-bsr-by-vif-addr: ipv4
        bsr-priority: 0-255
        hash-mask-len: 4-32
    }
}
cand-rp {
    group-prefix: ipv4net {
        is-scope-zone: [true|false]
        cand-bsr-by-vif-name: 1-4096
        cand-bsr-by-vif-addr: ipv4
        rp-priority: 0-255
        rp-holdtime: 0-65535
    }
}
switch-to-spt-threshold {
    disable: [true|false]
    interval: 3-2147483647
    bytes: 0-4294967296
}
traceoptions {
    flag {
        all {
            disable: [true|false]
        }
    }
}
}
}

```

---

## Parameters

---

<b>disable</b>	<p>Optional. Enables or disables PIM-SM for IPv4 on the router. Supported values are:</p> <p><b>true:</b> Disables PIM-SM for IPv4 on the router, without discarding the configuration.</p> <p><b>false:</b> Enables PIM-SM for IPv4 on the router.</p> <p>The default is <b>false</b>.</p>
----------------	---

---

<b>interface</b>	<p>Mandatory. Multi-node. The name of the Ethernet interface on which you are enabling PIM-SM for IPv4. The network interface must already be created and configured with an IPv4 address.</p> <p>(See “Chapter 3: Ethernet Interfaces, VLANs, and Bridging” for information on creating and configuring network interfaces.)</p> <p>You can enable PIM-SM on more than one interface by creating multiple <b>interface</b> configuration nodes within the <b>pimsm4</b> node.</p>
<b>disable</b>	<p>Optional. Enables or disables PIM-SM for IPv4 on this interface. Supported values are:</p> <p><b>true</b>: Disables PIM-SM for IPv4 on this interface, without discarding the configuration.</p> <p><b>false</b>: Enables PIM-SM or IPv4 on this interface.</p> <p>The default is <b>false</b>.</p>
<b>enable-ip-router-alert-option-check</b>	<p>Optional. Specifies whether to check for the IP Router Alert option in IP packets. The Router Alert option is IP option 20, as specified in RFC 2113. It can be used to alert transit routers to more closely examine the contents of an IP packet. Supported values are as follows:</p> <p><b>true</b>: The router will check to see if the IP Router Alert option is flagged.</p> <p><b>false</b>: The router will not check to see if the IP Router Alert option is flagged.</p> <p>The default is <b>false</b>.</p>
<b>dr-priority</b>	<p>Optional. This router’s Designated Router (DR) priority for this interface. The PIM router on this subnet with the highest value of DR priority will become the DR for the subnet.</p> <p>The range is 0 to 255. The default is 1.</p>
<b>hello-period</b>	<p>Optional. The interval, in seconds, at which the router sends hello messages to neighbors. Hello messages are automatically sent on bootup. After that, hello messages will be sent at this interval.</p> <p>The range is 1 to 18724. The default is 30.</p>
<b>hello-triggered-delay</b>	<p>Optional. Sets the randomized triggered delay, in seconds, for hello messages.</p> <p>When the router learns a new generation ID (PIM-SM GenID) for a neighbor, the router unicasts a hello message to the neighbor after this delay. This triggers the neighbor to establish neighborship with all routers as soon as possible.</p> <p>The range is 1 to 255. The default is 5.</p>

---

<b>alternative-subnet</b>	<p>Optional. Multi-node. Used to associate additional IP subnets with a network interface. The format is an IPv4 network in <i>address/prefix</i> format.</p> <p>One use of this directive is to make incoming traffic with a non-local source address appear as if it is coming from a local subnet. Typically, this is needed as a work-around solution when unidirectional interfaces such as satellite links are used for receiving traffic.</p> <p>You can define more than one alternative subnet by creating multiple <b>alternative-subnet</b> configuration nodes.</p> <p>This directive should be used with extreme care, because it is possible to create forwarding loops.</p>
<b>static-rps</b>	<p>Manually configures PIM rendezvous point (RP) router information.</p> <p>A PIM-SM router must either have some RPs configured as static RPs, or it must run the PIM-SM bootstrap mechanism (see the <b>bootstrap</b> directive). One or more RPs can be configured.</p> <p>It is important that all routers in a PIM domain make the same choice of RP for the same multicast group, so generally they should be configured with the same RP information.</p>
<b>rp</b>	<p>Multi-node. The IPv4 address of a router that will be a static RP.</p> <p>At least one RP must be specified.</p> <p>You can define more than one static RP by creating multiple <b>rp</b> configuration nodes.</p>
<b>group-prefix</b>	<p>Multi-node. The range of multicast addresses for which the specified router is willing to be the RP. The format is an IPv4 network in <i>address/prefix</i> format.</p> <p>You can define more than one set of multicast addresses for a static RP by creating multiple <b>group-prefix</b> configuration nodes.</p>
<b>rp-priority</b>	<p>Optional. The priority of the RP for this multicast group.</p> <p>If multiple RP routers are known for a particular multicast group, then the one with the most specific group prefix will be used. If more than one router has an equally specific group prefix, then the one with the highest RP priority is used. See also <b>hash-mask-len</b>.</p> <p>The range is 0 to 255. The default is 192.</p>

---

<b>hash-mask-len</b>	<p>Optional. The number of bits in the group IP address to which the hash function will be applied.</p> <p>If multiple routers all have the most specific group prefixes and the highest RP priority, then to balance load a hash function is used to choose the RP. At the same time, it is usually desirable for closely associated multicast groups to use the same RP. Thus the hash function is only applied to the first <i>n</i> bits of the group IP address, ensuring that if two groups have the same first <i>n</i> bits, they will hash to the same RP address. The <b>hash-mask-len</b> parameter specifies the value of <i>n</i>.</p> <p>The range is 4 to 32. The default is 30.</p> <p>Typically this value should not be changed. If it is modified, then all PIM-SM routers must be configured with the same value.</p>
<b>bootstrap</b>	<p>Configures the automatic bootstrapping of PIM RP router information using the PIM bootstrap router mechanism.</p> <p>A PIM-SM router must either run the PIM-SM bootstrap mechanism, or have at least one RP configured as a static RP (see the <b>static-rps</b> directive).</p>
<b>disable</b>	<p>Optional. Indicates whether or not the router will run the PIM-SM automatic bootstrap mechanism. Supported values are as follows:</p> <p><b>true</b>: The router will not run the PIM-SM automatic bootstrap mechanism, but the configuration will be preserved.</p> <p><b>false</b>: The router will run the PIM-SM automatic bootstrap mechanism.</p> <p>The default is <b>false</b>.</p>
<b>cand-bsr</b>	<p>Optional. Designates this router as a candidate to be the Bootstrap Router (BSR) for this PIM-SM domain. The router will become the BSR only if it wins the BSR election process.</p> <p>At least one scope zone must be specified for a candidate BSR router.</p>
<b>scope-zone</b>	<p>Multi-node. Defines one multicast group prefix for which this router is willing to be BSR. The format is an IPv4 network in <i>address/prefix</i> format.</p> <p>At least one scope zone is mandatory for a candidate BSR router.</p> <p>You can define more than one scope zone by creating multiple <b>scope-zone</b> configuration nodes.</p>

<b>is-scope-zone</b>	<p>Optional. Indicates whether this multicast group prefix defines a multicast scope zone. Supported values are as follows:</p> <p><b>true</b>—This multicast group prefix defines a multicast scope zone.</p> <p><b>false</b>—This multicast group prefix merely represents a range of multicast groups for which this router is willing to be BSR.</p> <p>The default is false.</p>
<b>cand-bsr-by-vif-name</b>	Mandatory. The name of the vif whose IP address will be used in the PIM bootstrap messages.
<b>cand-bsr-by-vif-addr</b>	Optional. The address to be used in the PIM bootstrap messages.
<b>bsr-priority</b>	<p>Optional. The BSR priority for this router. This value will be used in the PIM-SM BSR election process. For each scope-zone, the candidate bootstrap router with the highest BSR priority will be chosen to be BSR.</p> <p>The range is 0 to 255. The default is 1.</p>
<b>hash-mask-len</b>	<p>Optional. The number of bits in the group IP address to which the hash function will be applied.</p> <p>The BSR mechanism announces a list of Candidate RPs (C-RPs) for each scope zone to the other routers in the scope zone. To balance load, those routers then use a hash function to choose the RP for each multicast group from amongst the C-RPs. However, it is usually desirable for closely associated multicast groups to use the same RP. Thus the hash function is only applied to the first <i>n</i> bits of the group IP address, ensuring that if two groups have the same first <i>n</i> bits, they will hash to the same RP address. The <b>hash-mask-len</b> parameter specifies the value of <i>n</i>.</p> <p>The range is 4 to 32. The default is 30.</p> <p>Typically this value should not be changed. If it is modified, then all PIM-SM routers must be configured with the same value.</p>
<b>cand-rp</b>	<p>Optional. Designates this router as a candidate to be an RP for this PIM-SM domain. It will become an RP only if the BSR elects it to be.</p> <p>At least one group prefix must be specified for this router to function as an RP.</p>

<b>group-prefix</b>	<p>The range of multicast addresses for which the specified router is willing to be the RP. The format is an IPv4 network in <i>address/prefix</i> format.</p> <p>At least one group prefix must be specified for this router to function as an RP.</p> <p>You can define more than one set of multicast addresses by creating multiple <b>group-prefix</b> configuration nodes.</p>
<b>is-scope-zone</b>	<p>Optional. Indicates whether this multicast group prefix defines a multicast scope zone. Supported values are as follows:</p> <p><b>true</b>: This multicast group prefix defines a multicast scope zone.</p> <p><b>false</b>: This multicast group prefix merely represents a range of multicast groups for which this router is willing to be RP.</p> <p>The default is <b>false</b>.</p>
<b>cand-rp-by-vif-name</b>	<p>Mandatory. The name of the vif whose IP address will be used as the RP address if this router becomes an RP.</p>
<b>cand-bsr-by-vif-addr</b>	<p>Optional. The address to be used as the RP address if this router becomes an RP.</p>
<b>rp-priority</b>	<p>Optional. The priority of the specified RP router for this group prefix.</p> <p>If multiple RP routers are known for a particular multicast group, then the one with the most specific group prefix will be used. If more than one router has an equally specific group prefix, then the one with the highest RP priority is used. See also <b>hash-mask-len</b>.</p> <p>The range is 0 to 255. The default is 192.</p>
<b>rp-holdtime</b>	<p>Optional. The holdtime, in seconds, that this router will advertise when talking to the BSR. If the BSR has not heard a Candidate RP Advertisement from this router for <i>rp-holdtime</i> seconds, then the BSR will conclude it is dead, and will remove it from the set of possible RPs.</p> <p>The range is 0 to 65535. The default is 150.</p>
<b>switch-to-spt-threshold</b>	<p>Optional. Allows you to specify a bitrate threshold at a last-hop router or RP for switching from the RP tree to the shortest-path tree.</p>

<b>disable</b>	<p>Optional. Enables or disables bitrate-based switching to the shortest-path tree. Supported values are as follows:</p> <p><b>true:</b> Disables bitrate-based switching to the shortest-path tree, without discarding configuration.</p> <p><b>false:</b> Enables bitrate-based switching to the shortest-path tree.</p> <p>The default is <b>false</b>.</p>
<b>interval</b>	<p>Optional. The measurement interval, in seconds, for measuring the bitrate of traffic from a multicast sender.</p> <p>The measurement interval should normally not be set too small: values greater than ten seconds are recommended.</p> <p>The range is 3 to 2147483647. The default is 100.</p>
<b>bytes</b>	<p>Optional. The maximum number of bytes from a multicast sender that can be received in <i>interval</i> seconds. If this threshold is exceeded, the router will attempt to switch to the shortest-path tree from that multicast sender.</p> <p>If you want shortest-path switch to happen immediately after the first packet is forwarded, set this value to 0.</p> <p>The range is 0 to 4294967296. The default is 0.</p>
<b>traceoptions</b>	Optional. Sets the tracing and debugging options for PIM-SM for IPv4.
<b>flag</b>	Optional. Specifies which tracing options are enabled.
<b>all</b>	Optional. All tracing options.
<b>disable</b>	<p>Optional. Enables or disables the specified tracing options. Supported values are as follows:</p> <p><b>true:</b> Disables tracing.</p> <p><b>false:</b> Enables tracing.</p> <p>The default is <b>false</b>.</p>

## Usage Guidelines

Use this command to configure PIM Sparse-Mode multicast routing for IPv4 interface/vifs.

## protocols pimsm6

Allows you to configure PIM-SM for IPv6 on the router.

---

### Syntax

<code>set protocols pimsm6 ...</code>	Use <b>set</b> to create the <b>pimsm6</b> configuration node, or to modify PIM-SM configuration.  Note that you cannot use <b>set</b> to change the identifier of a configuration node. To change this information, delete the old node and create a new node with the correct information.
<code>delete protocols pimsm6 ...</code>	Use <b>delete</b> to delete the <b>pimsm6</b> configuration node altogether, or to delete one of its subordinate nodes.

---

### Command Mode

Configuration mode.

---

### Configuration Statement

```
protocols {
  pimsm6 {
    disable:[true|false]
    interface eth0..eth23 {
      disable: [true|false]
      enable-ip-router-alert-option-check: [true|false]
      dr-priority: 1-255
      hello-period: 1-18724
      hello-triggered-delay: 1-255
      alternative-subnet ipv6net {}
    }
    static-rps {
      rp ipv4 {
        group-prefix ipv6net {
          rp-priority: 0-255
          hash-mask-len: 8-128
        }
      }
    }
    bootstrap {
      disable: [true|false]
      cand-bsr {
        scope-zone ipv6net{
```

```

        is-scope-zone: [true|false]
        cand-bsr-by-vif-name: text
        cand-bsr-by-vif-addr: ipv6
        bsr-priority: 0-255
        hash-mask-len: 8-128
    }
}
cand-rp {
    group-prefix: ipv6net {
        is-scope-zone: [true|false]
        cand-bsr-by-vif-name: text
        cand-bsr-by-vif-addr: ipv6
        rp-priority: 0-255
        rp-holdtime: 0-65535
    }
}
switch-to-spt-threshold {
    disable: [true|false]
    interval: 3-2147483647
    bytes: 0-4294967296
}
traceoptions {
    flag {
        all {
            disable: [true|false]
        }
    }
}
}
}

```

---

## Parameters

---

<b>disable</b>	<p>Optional. Enables or disables PIM-SM for IPv6 on the router. Supported values are:</p> <p><b>true:</b> Disables PIM-SM for IPv6 on the router, without discarding the configuration.</p> <p><b>false:</b> Enables PIM-SM for IPv6 on the router.</p> <p>The default is <b>false</b>.</p>
----------------	---

---

<b>interface</b>	<p>Mandatory. Multi-node. The name of the Ethernet interface on which you are enabling PIM-SM for IPv6. The network interface must already be created and configured with an IPv6 address.</p> <p>(See “Chapter 3: Ethernet Interfaces, VLANs, and Bridging” for information on creating and configuring network interfaces.)</p> <p>You can enable PIM-SM on more than one interface by creating multiple <b>interface</b> configuration nodes within the <b>pimsm6</b> node.</p>
<b>disable</b>	<p>Optional. Enables or disables PIM-SM for IPv6 on this interface. Supported values are:</p> <p><b>true</b>: Disables PIM-SM for IPv6 on this interface, without discarding the configuration.</p> <p><b>false</b>: Enables PIM-SM or IPv6 on this interface.</p> <p>The default is <b>false</b>.</p>
<b>enable-ip-router-alert-option-check</b>	<p>Optional. Specifies whether to check for the IP Router Alert option in IP packets. The Router Alert option is IP option 20, as specified in RFC 2113. It can be used to alert transit routers to more closely examine the contents of an IP packet. Supported values are as follows:</p> <p><b>true</b>: The router will check to see if the IP Router Alert option is flagged.</p> <p><b>false</b>: The router will not check to see if the IP Router Alert option is flagged.</p> <p>The default is <b>false</b>.</p>
<b>dr-priority</b>	<p>Optional. This router’s Designated Router (DR) priority for this interface. The PIM router on this subnet with the highest value of DR priority will become the DR for the subnet.</p> <p>The range is 0 to 255. The default is 1.</p>
<b>hello-period</b>	<p>Optional. The interval, in seconds, at which the router sends hello messages to neighbors. Hello messages are automatically sent on bootup. After that, hello messages will be sent at this interval.</p> <p>The range is 1 to 18724. The default is 30.</p>
<b>hello-triggered-delay</b>	<p>Optional. Sets the randomized triggered delay, in seconds, for hello messages.</p> <p>When the router learns a new generation ID (PIM-SM GenID) for a neighbor, the router unicasts a hello message to the neighbor after this delay. This triggers the neighbor to establish neighborship with all routers as soon as possible.</p> <p>The range is 1 to 255. The default is 5.</p>

---

<b>alternative-subnet</b>	<p>Optional. Multi-node. Used to associate additional IP subnets with a network interface. The format is an IPv6 network in <i>address/prefix</i> format.</p> <p>One use of this directive is to make incoming traffic with a non-local source address appear as if it is coming from a local subnet. Typically, this is needed as a work-around solution when unidirectional interfaces such as satellite links are used for receiving traffic.</p> <p>You can define more than one alternative subnet by creating multiple <b>alternative-subnet</b> configuration nodes.</p> <p>This directive should be used with extreme care, because it is possible to create forwarding loops.</p>
<b>static-rps</b>	<p>Manually configures PIM rendezvous point (RP) router information.</p> <p>A PIM-SM router must either have some RPs configured as static RPs, or it must run the PIM-SM bootstrap mechanism (see the <b>bootstrap</b> directive). One or more RPs can be configured.</p> <p>It is important that all routers in a PIM domain make the same choice of RP for the same multicast group, so generally they should be configured with the same RP information.</p>
<b>rp</b>	<p>Multi-node. The IPv6 address of a router that will be a static RP.</p> <p>At least one RP must be specified.</p> <p>You can define more than one static RP by creating multiple <b>rp</b> configuration nodes.</p>
<b>group-prefix</b>	<p>Multi-node. The range of multicast addresses for which the specified router is willing to be the RP. The format is an IPv6 network in <i>address/prefix</i> format.</p> <p>You can define more than one set of multicast addresses for a static RP by creating multiple <b>group-prefix</b> configuration nodes.</p>
<b>rp-priority</b>	<p>Optional. The priority of the RP for this multicast group.</p> <p>If multiple RP routers are known for a particular multicast group, then the one with the most specific group prefix will be used. If more than one router has an equally specific group prefix, then the one with the highest RP priority is used. See also <b>hash-mask-len</b>.</p> <p>The range is 0 to 255. The default is 192.</p>

---

<b>hash-mask-len</b>	<p>Optional. The number of bits in the group IP address to which the hash function will be applied.</p> <p>If multiple routers all have the most specific group prefixes and the highest RP priority, then to balance load a hash function is used to choose the RP. At the same time, it is usually desirable for closely associated multicast groups to use the same RP. Thus the hash function is only applied to the first <i>n</i> bits of the group IP address, ensuring that if two groups have the same first <i>n</i> bits, they will hash to the same RP address. The <b>hash-mask-len</b> parameter specifies the value of <i>n</i>.</p> <p>The range is 4 to 32. The default is 30.</p> <p>Typically this value should not be changed. If it is modified, then all PIM-SM routers must be configured with the same value.</p>
<b>bootstrap</b>	<p>Configures the automatic bootstrapping of PIM RP router information using the PIM bootstrap router mechanism.</p> <p>A PIM-SM router must either run the PIM-SM bootstrap mechanism, or have at least one RP configured as a static RP (see the <b>static-rps</b> directive).</p>
<b>disable</b>	<p>Optional. Indicates whether or not the router will run the PIM-SM automatic bootstrap mechanism. Supported values are as follows:</p> <p><b>true</b>: The router will not run the PIM-SM automatic bootstrap mechanism, but the configuration will be preserved.</p> <p><b>false</b>: The router will run the PIM-SM automatic bootstrap mechanism.</p> <p>The default is <b>false</b>.</p>
<b>cand-bsr</b>	<p>Optional. Designates this router as a candidate to be the Bootstrap Router (BSR) for this PIM-SM domain. The router will become the BSR only if it wins the BSR election process.</p> <p>At least one scope zone must be specified for a candidate BSR router.</p>
<b>scope-zone</b>	<p>Multi-node. Defines one multicast group prefix for which this router is willing to be BSR. The format is an IPv6 network in <i>address/prefix</i> format.</p> <p>At least one scope zone is mandatory for a candidate BSR router.</p> <p>You can define more than one scope zone by creating multiple <b>scope-zone</b> configuration nodes.</p>

<b>is-scope-zone</b>	<p>Optional. Indicates whether this multicast group prefix defines a multicast scope zone. Supported values are as follows:</p> <p><b>true</b>: This multicast group prefix defines a multicast scope zone.</p> <p><b>false</b>: This multicast group prefix merely represents a range of multicast groups for which this router is willing to be BSR.</p> <p>The default is <b>false</b>.</p>
<b>cand-bsr-by-vif-name</b>	Mandatory. The name of the vif whose IP address will be used in the PIM bootstrap messages.
<b>cand-bsr-by-vif-addr</b>	Optional. The address to be used in the PIM bootstrap messages.
<b>bsr-priority</b>	<p>Optional. The BSR priority for this router. This value will be used in the PIM-SM BSR election process. For each scope-zone, the candidate bootstrap router with the highest BSR priority will be chosen to be BSR.</p> <p>The range is 0 to 255. The default is 1.</p>
<b>hash-mask-len</b>	<p>Optional. The number of bits in the group IP address to which the hash function will be applied.</p> <p>The BSR mechanism announces a list of Candidate RPs (C-RPs) for each scope zone to the other routers in the scope zone. To balance load, those routers then use a hash function to choose the RP for each multicast group from amongst the C-RPs. However, it is usually desirable for closely associated multicast groups to use the same RP. Thus the hash function is only applied to the first <math>n</math> bits of the group IP address, ensuring that if two groups have the same first <math>n</math> bits, they will hash to the same RP address. The <b>hash-mask-len</b> parameter specifies the value of <math>n</math>.</p> <p>The range is 4 to 32. The default is 30.</p> <p>Typically this value should not be changed. If it is modified, then all PIM-SM routers must be configured with the same value.</p>
<b>cand-rp</b>	<p>Optional. Designates this router as a candidate to be an RP for this PIM-SM domain. It will become an RP only if the BSR elects it to be.</p> <p>At least one group prefix must be specified for this router to function as an RP.</p>

<b>group-prefix</b>	<p>The range of multicast addresses for which the specified router is willing to be the RP. The format is an IPv6 network in <i>address/prefix</i> format.</p> <p>At least one group prefix must be specified for this router to function as an RP.</p> <p>You can define more than one set of multicast addresses by creating multiple <b>group-prefix</b> configuration nodes.</p>
<b>is-scope-zone</b>	<p>Optional. Indicates whether this multicast group prefix defines a multicast scope zone. Supported values are as follows:</p> <p><b>true</b>: This multicast group prefix defines a multicast scope zone.</p> <p><b>false</b>: This multicast group prefix merely represents a range of multicast groups for which this router is willing to be RP.</p> <p>The default is <b>false</b>.</p>
<b>cand-rp-by-vif-name</b>	<p>Mandatory. The name of the vif whose IP address will be used as the RP address if this router becomes an RP.</p>
<b>cand-bsr-by-vif-addr</b>	<p>Optional. The address to be used as the RP address if this router becomes an RP.</p>
<b>rp-priority</b>	<p>Optional. The priority of the specified RP router for this group prefix.</p> <p>If multiple RP routers are known for a particular multicast group, then the one with the most specific group prefix will be used. If more than one router has an equally specific group prefix, then the one with the highest RP priority is used. See also <b>hash-mask-len</b>.</p> <p>The range is 0 to 255. The default is 192.</p>
<b>rp-holdtime</b>	<p>Optional. The holdtime, in seconds, that this router will advertise when talking to the BSR. If the BSR has not heard a Candidate RP Advertisement from this router for <i>rp-holdtime</i> seconds, then the BSR will conclude it is dead, and will remove it from the set of possible RPs.</p> <p>The range is 0 to 65535. The default is 150.</p>
<b>switch-to-spt-threshold</b>	<p>Optional. Allows you to specify a bitrate threshold at a last-hop router or RP for switching from the RP tree to the shortest-path tree.</p>

<b>disable</b>	<p>Optional. Enables or disables bitrate-based switching to the shortest-path tree. Supported values are as follows:</p> <p><b>true:</b> Disables bitrate-based switching to the shortest-path tree, without discarding configuration.</p> <p><b>false:</b> Enables bitrate-based switching to the shortest-path tree.</p> <p>The default is <b>false</b>.</p>
<b>interval</b>	<p>Optional. The measurement interval, in seconds, for measuring the bitrate of traffic from a multicast sender.</p> <p>The measurement interval should normally not be set too small: values greater than ten seconds are recommended.</p> <p>The range is 3 to 2147483647. The default is 100.</p>
<b>bytes</b>	<p>Optional. The maximum number of bytes from a multicast sender that can be received in <i>interval</i> seconds. If this threshold is exceeded, the router will attempt to switch to the shortest-path tree from that multicast sender.</p> <p>If you want shortest-path switch to happen immediately after the first packet is forwarded, set this value to 0.</p> <p>The range is 0 to 4294967296. The default is 0.</p>
<b>traceoptions</b>	Optional. Sets the tracing and debugging options for PIM-SM for IPv6.
<b>flag</b>	Optional. Specifies which tracing options are enabled.
<b>all</b>	Optional. All tracing options.
<b>disable</b>	<p>Optional. Enables or disables the specified tracing options. Supported values are as follows:</p> <p><b>true:</b> Disables tracing.</p> <p><b>false:</b> Enables tracing.</p> <p>The default is <b>false</b>.</p>

## Usage Guidelines

Use this command to configure PIM Sparse-Mode multicast routing for IPv6 interface/vifs.

# show pim bootstrap

Displays information about the IPv4 bootstrap zones that are currently in use.

---

## Command Mode

Operational mode.

---

## Syntax

```
show pim bootstrap
```

---

## Parameters

None.

---

## Usage Guidelines

Use this command to display information about IPv4 PIM bootstrap routers.

## show pim bootstrap rps

Displays information about IPv4 Candidate RP information received by the bootstrap mechanism.

---

### Command Mode

Operational mode.

---

### Syntax

```
show pim bootstrap rps
```

---

### Parameters

None.

---

### Usage Guidelines

Use this command to display IPv4 Candidate RP information received by the bootstrap.

# show pim interface

Displays information about IPv4 PIM-SM network interfaces.

---

## Command Mode

Operational mode.

---

## Syntax

```
show pim interface
```

---

## Parameters

None.

---

## Usage Guidelines

Use this command to display information about the network interfaces that have been configured for IPv4 PIM-SM.

## show pim interface address

Displays address information about IPv4 PIM-SM network interfaces.

---

### Command Mode

Operational mode.

---

### Syntax

```
show pim interface address
```

---

### Parameters

None.

---

### Usage Guidelines

Use this command to display address information for network interfaces that have been configured for IPv4 PIM-SM.

# show pim join

Displays information about IPv4 PIM-SM multicast routing state.

---

## Command Mode

Operational mode.

---

## Syntax

```
show pim join
```

---

## Parameters

None.

---

## Usage Guidelines

Use this command to display multicast state information for IPv4 PIM-SM interfaces.

# show pim mfc

Displays information about IPv4 PIM multicast forwarding entries installed in the MFEA.

---

## Command Mode

Operational mode.

---

## Syntax

```
show pim mfc
```

---

## Parameters

None.

---

## Usage Guidelines

Use this command to display information about IPv4 PIM multicast forwarding entries that are installed in the multicast forwarding engine.

# show pim mrib

Displays information about the MRIB used by IPv4 PIM.

---

## Command Mode

Operational mode.

---

## Syntax

```
show pim mrib
```

---

## Parameters

None.

---

## Usage Guidelines

Use this command to display information about the Multicast Routing Information Base (MRIB) used by IPv4 PIM.

# show pim neighbors

Displays information about this router's IPv4 PIM neighbor routers.

---

## Command Mode

Operational mode.

---

## Syntax

```
show pim neighbors
```

---

## Parameters

None.

---

## Usage Guidelines

Use this command to see the IPv4 PIM neighbors for this router.

# show pim rps

Displays information about the Candidate RP set for IPv4 PIM-SM.

---

## Command Mode

Operational mode.

---

## Syntax

```
show pim rps
```

---

## Parameters

None.

---

## Usage Guidelines

Use this command to display Candidate RP set information for IPv4 PIM-SM.

# show pim scope

Displays information about the IPv4 PIM scope zones for this router.

---

## Command Mode

Operational mode.

---

## Syntax

```
show pim neighbors
```

---

## Parameters

None.

---

## Usage Description

Use this command to see information about this router's scoped zones for IPv4 PIM-SM.

## show pim6 bootstrap

Displays information about the IPv6 bootstrap zones that are currently in use.

---

### Command Mode

Operational mode.

---

### Syntax

```
show pim6 bootstrap
```

---

### Parameters

None.

---

### Usage Guidelines

Use this command to display information about IPv6 PIM bootstrap routers.

## show pim6 bootstrap rps

Displays information about IPv6 Candidate RP information received by the bootstrap mechanism.

---

### Command Mode

Operational mode.

---

### Syntax

```
show pim6 bootstrap rps
```

---

### Parameters

None.

---

### Usage Guidelines

Use this command to display IPv6 Candidate RP information received by the bootstrap.

# show pim6 interface

Displays information about IPv6 PIM-SM network interfaces.

---

## Command Mode

Operational mode.

---

## Syntax

```
show pim6 interface
```

---

## Parameters

None.

---

## Usage Guidelines

Use this command to display information about the network interfaces that have been configured for IPv6 PIM-SM.

## show pim6 interface address

Displays address information about IPv6 PIM-SM network interfaces.

---

### Command Mode

Operational mode.

---

### Syntax

```
show pim6 interface address
```

---

### Parameters

None.

---

### Usage Guidelines

Use this command to display address information for network interfaces that have been configured for IPv6 PIM-SM.

# show pim6 join

Displays information about IPv6 PIM-SM multicast routing state.

---

## Command Mode

Operational mode.

---

## Syntax

```
show pim6 join
```

---

## Parameters

None.

---

## Usage Guidelines

Use this command to display multicast state information for IPv6 PIM-SM interfaces.

## show pim6 mfc

Displays information about IPv6 PIM multicast forwarding entries installed in the MFEA.

---

### Command Mode

Operational mode.

---

### Syntax

```
show pim6 mfc
```

---

### Parameters

None.

---

### Usage Guidelines

Use this command to display information about IPv6 PIM multicast forwarding entries that are installed in the multicast forwarding engine.

# show pim6 mrib

Displays information about the MRIB used by IPv6 PIM.

---

## Command Mode

Operational mode.

---

## Syntax

```
show pim6 mrib
```

---

## Parameters

None.

---

## Usage Guidelines

Use this command to display information about the Multicast Routing Information Base (MRIB) used by IPv6 PIM.

## show pim6 neighbors

Displays information about this router's IPv6 PIM neighbor routers.

---

### Command Mode

Operational mode.

---

### Syntax

```
show pim6 neighbors
```

---

### Parameters

None.

---

### Usage Guidelines

Use this command to see the IPv6 PIM neighbors for this router.

# show pim6 rps

Displays information about the Candidate RP set for IPv6 PIM-SM.

---

## Command Mode

Operational mode.

---

## Syntax

```
show pim6 rps
```

---

## Parameters

None.

---

## Usage Guidelines

Use this command to display Candidate RP set information for IPv6 PIM-SM.

## show pim6 scope

Displays information about the IPv6 PIM scope zones for this router.

---

### Command Mode

Operational mode.

---

### Syntax

```
show pim6 neighbors
```

---

### Parameters

None.

---

### Usage Description

Use this command to see information about this router's scoped zones for IPv6 PIM-SM.

## Chapter 13: Routing Policies

This chapter lists the commands you can use to create routing policies.

This chapter contains the following command.

Command	Mode	Description
<code>policy as-path-list</code>	Configuration	Allows you to create a list of AS paths, which can be referenced in BGP policy statements.
<code>policy community-list</code>	Configuration	Allows you to create a list of BGP communities, which can be referenced in BGP policy statements.
<code>policy network4-list</code>	Configuration	Allows you to create a list of IPv4 networks, which can be referenced in policy statements.
<code>policy network6-list</code>	Configuration	Allows you to create a list of IPv6 networks, which can be referenced in policy statements.
<code>policy</code> <code>policy-statement</code>	Configuration	Allows you to define policies that can be applied to routing protocols.

## policy as-path-list

Allows you to create a list of AS paths, which can be referenced in BGP policy statements.

---

### Command Mode

Configuration mode.

---

### Configuration Statement

```
policy {  
  as-path-list: text {  
    elements: text  
  }  
}
```

---

### Parameters

<b>as-path-list</b>	<p>Multi-node. Names a list of AS paths, which you can use in a routing policy match condition. The name may include numbers, letters, and hyphens only.</p> <p>You can define multiple AS path lists by creating multiple <b>as-path-list</b> configuration nodes.</p>
<b>elements</b>	<p>A regular expression defining a list of AS paths. Regular expressions must be enclosed in double quotes.</p>

---

### Usage Guidelines

Use this command to create a named list of AS paths, which you can use in BGP policy statement.

The name configured here is referred to in the match condition(s) of the policy statement.

## policy community-list

Allows you to create a list of BGP communities, which can be referenced in BGP policy statements.

---

### Command Mode

Configuration mode.

---

### Configuration Statement

```
policy {  
  community-list: text {  
    elements: text  
  }  
}
```

---

### Parameters

<b>community-list</b>	<p>Multi-node. Names a list of BGP communities, which you can use in a routing policy match condition. The name may include numbers, letters, and hyphens only.</p> <p>You can define multiple community lists by creating multiple <b>community-list</b> configuration nodes.</p>
<b>elements</b>	<p>A community identifier or a space-separated list of community identifiers surrounded by enclosed in double quotes.</p>

---

### Usage Guidelines

Use this command to create a named list of BGP communities, which you can use in BGP policy statements.

The name configured here is referred to in the match condition(s) of the policy statement.

# policy network4-list

Allows you to create a list of IPv4 networks, which can be referenced in policy statements.

---

## Command Mode

Configuration mode.

---

## Configuration Statement

```
policy {  
  network4-list: text {  
    elements: text  
  }  
}
```

---

## Parameters

<b>network4-list</b>	<p>Multi-node. Names a list of IPv4 networks, which you can use in a routing policy match condition. The name may include numbers, letters, and hyphens only.</p> <p>You can define multiple network lists by creating multiple <b>network4-list</b> configuration nodes.</p>
<b>elements</b>	<p>A regular expression defining a list of IPv4 networks. Regular expressions must be enclosed in double quotes.</p>

---

## Usage Guidelines

Use this command to create a named list of IPv4 networks, which you can use in a routing policy statement.

The name configured here is referred to in the match condition(s) of the policy statement.

## policy network6-list

Allows you to create a list of IPv6 networks, which can be referenced in policy statements.

---

### Command Mode

Configuration mode.

---

### Configuration Statement

```
policy {  
  network6-list: text {  
    elements: text  
  }  
}
```

---

### Parameters

<b>network6-list</b>	<p>Multi-node. Names a list of IPv6 networks, which you can use in a routing policy match condition. The name may include numbers, letters, and hyphens only.</p> <p>You can define multiple network lists by creating multiple <b>network6-list</b> configuration nodes.</p>
<b>elements</b>	<p>A regular expression defining a list of IPv6 networks. Regular expressions must be enclosed in double quotes.</p>

---

### Usage Guidelines

Use this command to create a named list of IPv6 networks, which you can use in a routing policy statement.

The name configured here is referred to in the match condition(s) of the policy statement.

# policy policy-statement

Allows you to define policies that can be applied to routing protocols.

---

## Command Mode

Configuration mode.

---

## Configuration Statement

```
policy {  
  policy-statement: text {  
    term: text {  
      from {  
        protocol: text  
        network4: ipv4net  
        network6: ipv6net  
        network4-list: text  
        network6-list: text  
        prefix-length4: 0-32-range  
        prefix-length6: 0-128-range  
        nexthop4: ipv4-range  
        nexthop6: ipv6-range  
        as-path: text  
        as-path-list: text  
        community: text  
        community-list: text  
        neighbor: ipv4-range

## Parameters

Not every policy criterion in the **from**, **to**, and **then** parts of the term can be applied to every routing protocol; the applicable criteria vary with the protocol.

This section all lists parameters, regardless of their applicability. To see which options apply to which protocol, please see Table 13-3 in the Usage Guidelines.

<b>policy-statement</b>	<p>Mandatory. Multi-node. Defines a named routing policy statement.</p> <p>You can define multiple policy statements by creating multiple <b>policy-statement</b> configuration nodes.</p>
<b>term</b>	<p>Mandatory. Multi-node. A unique numeric identifier for the term within this policy statement.</p> <p>You can define multiple policy terms by creating multiple <b>term</b> configuration nodes.</p>
<b>from</b>	<p>Defines a match condition for a route based on information about the source contained in the routing update. All specified criteria must match for the match condition to succeed.</p>
<b>protocol</b>	<p>The source protocol. Supported values are as follows:</p> <p><b>connected</b>: The route is to a directly connected network.</p> <p><b>static</b>: The route is a static route.</p> <p><b>bgp</b>: The route was learned through BGP.</p> <p><b>rip</b>: The route was learned through RIP.</p> <p><b>ospf</b>: The route was learned through OSPF.</p>
<b>network4</b>	<p>Match the route based on its source IPv4 network. The format is <i>address/prefix</i>.</p>
<b>network6</b>	<p>Match the route based on its source IPv6 network. The format is <i>address/prefix</i>.</p>
<b>network4-list</b>	<p>Match the route based a named list of IPv4 networks. The list is defined and named using the the <b>policy network4-list</b> command (see page 280).</p>
<b>network6-list</b>	<p>Match the route based a named list of IPv6 networks. The list is defined and named using the the <b>policy network6-list</b> command (see page 281).</p>
<b>prefix-length4</b>	<p>Match the route based on its IPv4 prefix length. The range is 0 to 32.</p>

<b>prefix-length6</b>	Match the route based on its IPv6 prefix length. The range is 0 to 128.
<b>nexthop4</b>	Match the route based on the next-hop address specified in the route announcement. The format is a match expression based on an IPv4 address.
<b>nexthop6</b>	Match the route based on the next-hop address specified in the route announcement. The format is a match expression based on an IPv6 address.
<b>as-path</b>	Match the route based on its AS path. This is a regular expression directly defining a BGP AS path filter, for example “ <b>100 10</b> ”. Regular expressions must be enclosed in double quotes.
<b>as-path-list</b>	Match the route based on an AS path regular expression defined under the specified name.
<b>community</b>	<p>Match the route based on its BGP communities. The format is a community identifier or a space-separated list of community identifiers enclosed in double quotes.</p> <p>The router recognizes the following BGP well-known communities as per RFC 1997:</p> <p><b>NO_EXPORT</b>: All routes received carrying a communities attribute containing this value are not advertised outside a BGP confederation boundary (a stand-alone autonomous system that is not part of a confederation should be considered a confederation itself).</p> <p><b>NO_ADVERTISE</b>: All routes received carrying a communities attribute containing this value are not advertised to other BGP peers.</p> <p><b>NO_SUBCONFED</b>: All routes received carrying a communities attribute containing this value are not advertised to external BGP peers (this includes peers in other members autonomous systems inside a BGP confederation).</p>
<b>community-list</b>	Match the route based a named community list networks. The list is defined and named using the the <b>policy community-list</b> command (see page 279).

<b>neighbor</b>	Match the route based on the address of one or more BGP peers. The address can be a directly connected or an indirectly connected peer. The format is a match expression based on IPv4 addresses.
<b>origin</b>	Match the route based on an integer representing the value of the BGP ORIGIN attribute, which is the origin of the AS path information. Supported values are as follows: <b>0:</b> IGP <b>1:</b> EGP <b>2:</b> Incomplete
<b>med</b>	Match the route based on the multiple exit discriminator (MED). The format is a match expression based on the MED.
<b>localpref</b>	Match the route based on the value of the BGP LOCAL_PREF attribute. The format is a match expression based on the value of the LOCAL_PREF attribute, which is a number from 0 to 4294967295.
<b>metric</b>	Match the route based on its metric. The format is a match expression based on the value of the metric.
<b>external</b>	Sets the type of the external OSPF route. The format is a match expression based on the following values: <b>type-1:</b> Type 1 external OSPF route. <b>type-2:</b> Type 2 external OSPF route.
<b>tag</b>	Match the route based on its tag. The format is a match expression based on the value of the tag.
<b>to</b>	Defines a match condition for a route based on information about the destination in the routing update. All specified criteria must match for the match condition to succeed.
<b>network4</b>	Match the route based on its destination IPv4 network. The format is <i>address/prefix</i> .
<b>network6</b>	Match the route based on its destination IPv6 network. The format is <i>address/prefix</i> .
<b>network4-list</b>	Match the route based a named list of IPv4 networks. The list is defined and named using the the <b>policy network4-list</b> command (see page 280).

<b>network6-list</b>	Match the route based a named list of IPv6 networks. The list is defined and named using the the <b>policy network6-list</b> command (see page 281).
<b>prefix-length4</b>	Match the route based on its IPv4 prefix length. The range is 0 to 32.
<b>prefix-length6</b>	Match the route based on its IPv6 prefix length. The range is 0 to 128.
<b>nexthop4</b>	Match the route based on the next-hop address specified in the route announcement. The format is a match expression based on an IPv4 address.
<b>nexthop6</b>	Match the route based on the next-hop address specified in the route announcement. The format is a match expression based on an IPv6 address.
<b>as-path</b>	Match the route based on its AS path. This is a regular expression directly defining a BGP AS path filter. Regular expressions must be enclosed in double quotes.
<b>as-path-list</b>	Match the route based on an AS path regular expression defined under the specified name.
<b>community</b>	<p>Match the route based on its communities. The format is a community identifier or a space-separated list of community identifiers enclosed in double quotes.</p> <p>The router recognizes the following BGP well-known communities as per RFC 1997:</p> <p><b>NO_EXPORT:</b> All routes received carrying a communities attribute containing this value are not advertised outside a BGP confederation boundary (a stand-alone autonomous system that is not part of a confederation should be considered a confederation itself).</p> <p><b>NO_ADVERTISE:</b> All routes received carrying a communities attribute containing this value are not advertised to other BGP peers.</p> <p><b>NO_SUBCONFED:</b> All routes received carrying a communities attribute containing this value are not advertised to external BGP peers (this includes peers in other members autonomous systems inside a BGP confederation).</p>

<b>community-list</b>	Match the route based a named community list networks. The list is defined and named using the the <b>policy community-list</b> command (see page 279).
<b>neighbor</b>	Match the route based on the address of one or more BGP peers. The address can be a directly connected or an indirectly connected peer. The format is a match expression based on IPv4 addresses.
<b>origin</b>	Match the route based on an integer representing the value of the BGP ORIGIN attribute, which is the origin of the AS path information. Supported values are as follows:  <b>0:</b> IGP <b>1:</b> EGP <b>2:</b> Incomplete
<b>med</b>	Match the route based on the multiple exit discriminator (MED). The format is a match expression based on the MED.
<b>localpref</b>	Match the route based on the value of the BGP LOCAL_PREF attribute. The format is a match expression based on the value of the LOCAL_PREF attribute, which is a number from 0 to 4294967295.
<b>was-aggregated</b>	Match the route based on the value of the ATOMIC_AGGREGATED attribute. This will be true if this route contributed to origination of an aggregate. The format is a match expression based on the value of the ATOMIC_AGGREGATED attribute.
<b>metric</b>	Match the route based on its metric. The format is a match expression based on the value of the metric.
<b>external</b>	Sets the type of the external OSPF route. The format is a match expression based on the following values:  <b>type-1:</b> Type 1 external OSPF route. <b>type-2:</b> Type 2 external OSPF route.
<b>tag</b>	Match the route based on its tag. The format is a match expression based on the value of the tag.
<b>then</b>	Defines the set of actions to be taken if all match conditions succeed. The default action is <b>accept</b> routes; that is, all routes are implicitly accepted.

---

<b>action</b>	<p>How to process routes matching the criteria. Supported actions are as follows:</p> <p><b>accept:</b> Accept the route and propagate it. After a route is accepted, no other terms in the routing policy and no other routing policies are evaluated. This is the default action.</p> <p><b>reject:</b> Reject the route and do not propagate it. After a route is rejected, no other terms in the routing policy and no other routing policies are evaluated.</p>
<b>trace</b>	<p>Sets the level of detail for tracing. The range is 0 to 3, where 0 disables tracing and 3 provides the highest level of detail. The default is 0.</p>
<b>nexthop4</b>	<p>Specifies the next hop. Supported values are as follows:</p> <p><b>self:</b> The next-hop address will be replaced with the local IP address used for BGP adjacency. Note that a router cannot install routes with itself as the next hop.</p> <p><i>ipv4:</i> The next-hop address will be replaced with the specified IPv4 address.</p> <p><b>peer-address:</b> Valid only for import policies. The next-hop address will be replaced with the IP address of the peer from which this route was received. This option is primarily used by BGP to enforce using the peer's IP address for advertised routes. It is meaningful only when the next hop is the advertising router or another directly connected router.</p>
<b>nexthop6</b>	<p>Specifies the next hop. Supported values are as follows:</p> <p><b>self:</b> The next-hop address will be replaced with the local IP address used for BGP adjacency. Note that a router cannot install routes with itself as the next hop.</p> <p><i>ipv6:</i> The next-hop address will be replaced with the specified IPv6 address.</p> <p><b>peer-address:</b> Valid only for import policies. The next-hop address will be replaced with the IP address of the peer from which this route was received. This option is primarily used by BGP to enforce using the peer's IP address for advertised routes. It is meaningful only when the next hop is the advertising router or another directly connected router.</p>

---

---

<b>as-path-prepend</b>	<p>Affixes the specified AS number(s) at the beginning of the AS path. If specifying more than one AS number, surround the space-separated list with quotation marks.</p> <p>This action adds AS numbers to <b>as-path</b> sequences only; it does not add AS numbers to <b>as-path-list</b> sequences.</p>
<b>as-path-expand</b>	<p>Extracts the last AS number in the existing AS path and affix that AS number to the beginning of the AS path <i>n</i> times, where <i>n</i> is the specified integer. The AS number is added before the local AS number has been added to the path.</p> <p>This action adds AS numbers to <b>as-path</b> sequences only; it does not add AS numbers to <b>as-path-list</b> sequences.</p> <p>The range is 0 to 32.</p>
<b>community</b>	<p>Replaces any communities that were in the route with the specified communities. The format is a community identifier or a space-separated list of community identifiers surrounded by enclosed in double quotes.</p> <p>The router recognizes the following BGP well-known communities as per RFC 1997:</p> <p><b>NO_EXPORT:</b> All routes received carrying a communities attribute containing this value are not advertised outside a BGP confederation boundary (a stand-alone autonomous system that is not part of a confederation should be considered a confederation itself).</p> <p><b>NO_ADVERTISE:</b> All routes received carrying a communities attribute containing this value are not advertised to other BGP peers.</p> <p><b>NO_SUBCONFED:</b> All routes received carrying a communities attribute containing this value are not advertised to external BGP peers (this includes peers in other members autonomous systems inside a BGP confederation).</p>
<b>community-add</b>	<p>Adds the specified communities to the set of communities in the route. To specify more than one community, use a space-separated list of community names, surrounded by quotation marks.</p>
<b>community-del</b>	<p>Deletes the specified communities from the set of communities in the route. To specify more than one community, use a space-separated list of community names, surrounded by quotation marks.</p>

---

<b>origin</b>	Sets the value of the BGP ORIGIN attribute to the specified integer.
<b>med</b>	Sets the multiple exit discriminator (MED) to the specified value.
<b>med-remove</b>	Specifies whether or not the multiple exit discriminator (MED) should be removed. Supported values are as follows:  <b>true:</b> Remove the MED. <b>false:</b> Do not remove the MED.
<b>localpref</b>	Sets the BGP LOCAL_PREF attribute to the specified value.
<b>aggregate-prefix-len</b>	Sets the aggregate prefix length to the specified value.
<b>aggregate-brief-mode</b>	Does not generate AS_SETs for aggregate routes.
<b>metric</b>	Set the metric to the specified value.
<b>external</b>	Set the type of external OSPF route to one of the following types:  <b>type-1:</b> Type 1 external OSPF route. <b>type-2:</b> Type 2 external OSPF route.
<b>tag</b>	Set the tag to the specified value.

## Usage Guidelines

Use this command to configure routing policies. Once the policy is defined, it must be explicitly applied to the routing protocol using the **import** and/or **export** directives in routing protocol configuration.

A policy consists of some number of *policy statements*. A policy statement consists of some number of *terms*. Each term is structured as follows:

- **from.** The **from** statement in a term describes the match conditions for the source of the route.
- **to.** The **to** statement in a term describes the match conditions for the destination of the route.
- **then.** The **then** statement in a term defines the actions that will be taken if all match conditions are met.

For the defined actions to be taken, all criteria in all defined match conditions must be met. If any criterion in a match condition is not met the match condition fails, and if any of multiple match conditions fails the match fails.

## Criteria Operators

Some of the match criteria defined in **from** and **to** policy-statement terms can use operators in addition to the criteria value. For example, a **from** policy-statement term could include a **prefix-length4 > 24** statement. This would match routes with a prefix length greater than 24. In this case, the greater-than sign (“>”) is the operator.

If no operator is explicitly defined, each criterion has a default operator value. For example, by default, the operator for **prefix-length4** is equals (“==”).

Table 13-1 shows the definitions for policy operators.

Table 13-1 Operator Definitions

Operator	Example	Description
:	10.10.35.0:10.10.35.254	Specifies a range of values, such as a range of numbers or IP addresses. Example: “Is an IPv4 address between 10.10.35.0 and 10.10.35.254, inclusive.”
==	==15	Is equal to. Example: “Is equal to 15.”
!=	!=0	Is not equal to. Example: “Is not equal to 0.”
<	<15	Is less than. Example: “Is less than 15.”
>	>12	Is greater than. Example: “Is greater than 12.”
<=	<=12	Is less than or equal to. Example: “Is less than or equal to 12.”
>=	>=12	Is greater than or equal to. Example: “Is greater than or equal to 12.”

The following criteria allow operators.

Table 13-2 Matching criteria allowing operators

Criterion	Matching Operators Allowed
localpref	all
med	all
metric	all
neighbor	all
network4	all
network4-list	all

Table 13-2 Matching criteria allowing operators

Criterion	Matching Operators Allowed
nexthop	all
origin	all
prefix-length	all
tag	all

## Protocol-Specific Criteria

Not every criterion in the **from**, **to**, and **then** parts of the term can be applied to every routing protocol; the applicable criteria vary with the protocol. Table 13-3 shows which options apply to which protocols.

## Regular Expressions

Regular expressions provide the ability to perform pattern matching are used to parse data sets within AS path lists and community lists. In general, a regular expression takes the following form:

*<regex-term><operator>*

where *<regex-term>* is a string to be matched, and *<operator>* is one of the operators shown in Table 13-1.

Note that operators must occur immediately after *<regex-term>* with no intervening space, with the following exceptions:

- The vertical bar operator (“|”) and hyphen (“-”) operator, both of which are placed between two terms
- Parentheses, which enclose *<regex-term>*s.

Table 13-4 shows the regular expression operators supported in policy statements.

Table 13-4 Regular expression operators

Operator	Description
$\{m,n\}$	At least <i>m</i> and at most <i>n</i> repetitions of <i>regex-term</i> . Both <i>m</i> and <i>n</i> must be positive integers, and <i>m</i> must be smaller than <i>n</i> .
$\{m\}$	Exactly <i>m</i> repetitions of <i>regex-term</i> . <i>m</i> must be a positive integer.
$\{m, \}$	<i>m</i> or more repetitions of <i>regex-term</i> . <i>m</i> must be a positive integer.
*	Zero or more repetitions of <i>regex-term</i> . This is equivalent to $\{0,\}$ .
+	One or more repetitions of <i>regex-term</i> . This is equivalent to $\{1,\}$ .
?	Zero or one repetition of <i>regex-term</i> . This is equivalent to $\{0,1\}$ .
	One of the two <i>regex-term</i> on either side of the vertical bar.
-	Between a starting and ending range, inclusive.
^	Character at the beginning of an AS path regular expression. This character is added implicitly; therefore, the use of it is optional.
\$	Character at the end of an AS path regular expression. This character is added implicitly; therefore, the use of it is optional.
( )	A group of <i>regex-terms</i> that are enclosed in the parentheses. If enclosed in quotation marks with no intervening space (“()”), indicates a null. Intervening space between the parentheses and the <i>regex-term</i> is ignored.

Table 13-4 Regular expression operators

Operator	Description
[ ]	Set of characters. One character from the set can match. To specify the start and end of a range, use a hyphen (-).
^	NOT operator.

## Chapter 14: VRRP

This chapter lists the commands for setting up the Virtual Router Redundancy Protocol on the Vyatta OFR.

This chapter contains the following commands.

Command	Mode	Description
<code>clear vrrp</code>	Operational	Restarts the VRRP process on the router, setting all interface statistics to zero.
<code>interfaces ethernet vrrp</code>	Configuration	Allows you to configure a VRRP group on an Ethernet interface.
<code>interfaces ethernet vif vrrp</code>	Configuration	Allows you to configure a VRRP group on a vif.
<code>show vrrp</code>	Operational	Displays VRRP information about VRRP groups.

# clear vrrp

Restarts the VRRP process on the router, setting all interface statistics to zero.

---

## Command Mode

Operational mode.

---

## Syntax

```
clear vrrp[eth0..eth23]
```

---

## Parameters

<i>eth0..eth23</i>	Clears VRRP statistics for the specified interface.
--------------------	---

---

## Usage Guidelines

Use this command to clear VRRP statistics.

Issuing this command restarts the VRRP process on the router. In doing this, it sets all VRRP statistics to zero.

- When used with no option, this command resets VRRP statistics for all configured interfaces.
- When an interface is specified, this command resets statistics for just the specified interface.

---

## Examples

Example 14-1 clears VRRP statistics on interface **eth0**.

Example 14-1 “clear vrrp”: Clearing VRRP statistics from an interface.

```
vyatta@vyatta> clear vrrp eth0
OK
vyatta@vyatta>
```

# show vrrp

Displays VRRP information about VRRP groups.

---

## Command Mode

Operational mode.

---

## Syntax

```
show vrrp
```

---

## Parameters

None.

---

## Usage Guidelines

Use this command to see information about VRRP groups, including current VRRP elections and statistics.

# interfaces ethernet vrrp

Allows you to configure a VRRP group on an Ethernet interface.

## Command Mode

Configuration mode.

## Syntax

```
set interfaces ethernet name
  vrrp ...
```

Use **set** to create the **vrrp** configuration node for an interface, or to modify VRRP configuration.

```
delete interfaces ethernet name
  vrrp ...
```

Use **delete** to delete the **vrrp** configuration node for an interface.

## Configuration Statement

```
interfaces {
  ethernet [eth0..eth23] {
    vrrp {
      vrrp-group: 1-255
      virtual-address: ipv4
      authentication: text
      advertise-interval: 1-255
      preempt:[true|false]
      priority: 1-255
    }
  }
}
```

## Parameters

<b>ethernet</b>	The Ethernet interface you are configuring. The interface must already be defined.
<b>vrrp</b>	Enables VRRP on the interface.
<b>vrrp-group</b>	Defines a VRRP group on the interface. The group identifier is an integer that uniquely identifies a cluster of interfaces being managed by the VRRP process.  The range is 1 to 255. The default is 1.

<b>virtual-address</b>	Mandatory. The virtual IP address (VIP) of the virtual router. This will become the shared IP address of the group, which will float from one real router to another if the master router fails.
<b>authentication</b>	Optional. The plaintext password the interface will use to authenticate itself as a member of the group.
<b>advertise-interval</b>	Optional. The interval in seconds between VRRP advertisement packets. All routers in this VRRP group must use the same advertisement interval.  The range is 1 to 255. The default is 1.
<b>preempt</b>	Optional. Allows a high-priority VRRP backup router to assert itself as master over a lower-priority master router. Supported values are as follows:  <b>true:</b> Allow the master router to be preempted by a backup router with higher priority.  <b>false:</b> Do not allow the master router to be preempted by a backup router with higher priority.  The default is <b>true</b> ; that is, the master router can be preempted by a backup router with higher priority.
<b>priority</b>	Mandatory. Sets the priority of a real router, which determines the likelihood of its being elected the master router in a cluster of VRRP routers.  The range of values for the VRRP backup router(s) is from 3 to 254. The VRRP master router must have the highest priority, and typically has a priority of 255. The default is 1.

## Usage Guidelines

Use this command to define a VRRP group on an interface. The implementation is currently restricted to one VRRP group per interface, regardless of whether the group is defined at the physical interface level or the vif level.

The group identifier is an integer that uniquely identifies a cluster of interfaces being managed by the VRRP process. The group identifier together with a virtual IP address (the VIP) uniquely define an interface on the virtual router.

The group identifier used to construct a virtual MAC address for the virtual router. The five highest-order octets of the MAC address are specified in the RFC for VRRP (RFC 2338) as “00-00-5E-00-01.” VRRP inserts the 8-byte group identifier as the lowest-order octet required to complete the MAC address. If you specify a group identifier of less than 8 bytes, the system prepends the necessary leading zeros to create a well-formed octet.

The same group identifier/VIP pair must be used by all interfaces providing redundancy for one another. Unless interfaces have the same group identifier and VIP, they will not communicate.

Interfaces being mapped to the VIP must be on the same subnet as the VIP, but should not have the identical IP address.

It is possible to configure a VIP to have the same address as a real interface on the router. In this case, that router is said to “own” the VIP, and it must be configured with the highest possible priority so that it automatically becomes the master. However, this should be avoided, because conflicts can arise over which of the real router or the virtual router should respond to ARPs and other requests directed at the VIP. In any case, no backup router can have the same IP address as the VIP.

To signal that it is still in service, the master router sends MAC-level multicast “heartbeat” packets called *advertisements* to the LAN segment, using the IP multicast address **224.0.0.18**, using **port 112** (VRRP’s well-known port). These advertisements confirm the health of the master to backup routers in the cluster, and contain other VRRP information, such as the master’s priority.

If the master fails to send advertisements for some interval (the “Master is Dead” timer), the master is considered out of service, and the VRRP process triggers failover to the backup router. In this case, the backup router with the highest priority value becomes the new master router.

The advertise interval on the master router is typically one-third of the Master is Dead timer on the backup router(s).

Each VRRP router can be configured with a priority between 1 and 255. The router with the highest priority is elected as the master router of the VRRP cluster.

The VRRP standard (RFC 2338) specifies that a router owning the virtual IP should be assigned a priority of 255, which automatically elects the router owning the VIP as master. If you configure a VIP that is the real IP address of an interface on a router, you must set the priority of that router as 255. In any case, the priority of the master router is typically set to 255.

The backup router can be left with the default priority. However, if you have more than one backup router, you should set different priorities to ensure election occurs correctly when required.

The VRRP advertisements sent out by the master router include the master router’s priority. If preemption is enabled, a backup router with a higher priority than the current master will “preempt” the master, and become the master itself. This might occur, for example, if a new backup router is brought online, while a lower-priority backup is acting as master.

A backup router preempts the master by beginning to send out its own VRRP advertisements. The master router examines these, and discovers that the backup router has a higher priority than itself. The master then stops sending out advertisements, while the backup continues to send, thus making itself the new master.

# interfaces ethernet vif vrrp

Allows you to configure a VRRP group on a vif.

---

## Command Mode

Configuration mode.

---

## Syntax

`set interfaces ethernet int.vif vrrp ...` Use **set** to create the **vrrp** configuration node for a vif, or to modify VRRP configuration.

`delete interfaces ethernet int.vif vrrp ...` Use **delete** to delete the **vrrp** configuration node of a vif.  
Note that the **vrrp-group** node is mandatory, and therefore cannot be deleted. If you delete the **vrrp-group** node, the system creates a new VRRP group with a group ID of 1.

---

## Configuration Statement

---

## Configuration Statement

```
interfaces {  
    ethernet [eth0..eth23] {  
        vif vlan-id {  
        }  
    }  
}
```

---

## Parameters

<b>vif</b>	The VLAN ID of the vifa. The vif must already be defined.  Note the notation for referring to the vif is <i>int.vif</i> . For example, to configure VRRP on vif 40 or eth1, use the statement <b>set interfaces ethernet eth1.40 vrrp....</b>
<b>vrrp</b>	Enables VRRP on the vif.

<b>vrrp-group</b>	<p>Defines a VRRP group on the vif. The group identifier is an integer that uniquely identifies a cluster of interfaces being managed by the VRRP process.</p> <p>At least one VRRP group must be defined. If you do not define one, or if you delete the last existing VRRP group, the system creates a <b>vrrp-group</b> node with a group ID of 1.</p> <p>The range is 1 to 255. The default is 1.</p>
<b>virtual-address</b>	<p>Mandatory. The virtual IP address (VIP) of the virtual router. This will become the shared IP address of the group, which will float from one real router to another if the master router fails.</p>
<b>authentication</b>	<p>Optional. The plaintext password the vif will use to authenticate itself as a member of the group.</p>
<b>advertise-interval</b>	<p>Optional. The interval in seconds between VRRP advertisement packets. All routers in this VRRP group must use the same advertisement interval.</p> <p>The range is 1 to 255. The default is 1.</p>
<b>preempt</b>	<p>Optional. Allows a high-priority VRRP backup router to assert itself as master over a lower-priority master router. Supported values are as follows:</p> <p><b>true</b>: Allow the master router to be preempted by a backup router with higher priority.</p> <p><b>false</b>: Do not allow the master router to be preempted by a backup router with higher priority.</p> <p>The default is <b>true</b>; that is, the master router can be preempted by a backup router with higher priority.</p>
<b>priority</b>	<p>Mandatory. Sets the priority of a real router, which determines the likelihood of its being elected the master router in a cluster of VRRP routers.</p> <p>The range of values for the VRRP backup router(s) is from 3 to 254. The VRRP master router must have the highest priority, and typically has a priority of 255. The default is 1.</p>

---

## Usage Guidelines

Use this command to define a VRRP group on a vif. The implementation is currently restricted to one VRRP group per interface, regardless of whether the group is defined at the physical interface level or the vif level.

The group identifier is an integer that uniquely identifies a cluster of interfaces being managed by the VRRP process. The group identifier together with a virtual IP address (the VIP) uniquely define a vif on the virtual router.

The group identifier used to construct a virtual MAC address for the virtual router. The five highest-order octets of the MAC address are specified in the RFC for VRRP (RFC 2338) as “00-00-5E-00-01.” VRRP inserts the 8-byte group identifier as the lowest-order octet required to complete the MAC address. If you specify a group identifier of less than 8 bytes, the system prepends the necessary leading zeros to create a well-formed octet.

The same group identifier/VIP pair must be used by all interfaces providing redundancy for one another. Unless interfaces have the same group identifier and VIP, they will not communicate.

Interfaces being mapped to the VIP must be on the same subnet as the VIP, but should not have the identical IP address.

It is possible to configure a VIP to have the same address as a real interface on the router. In this case, that router is said to “own” the VIP, and it must be configured with the highest possible priority so that it automatically becomes the master. However, this should be avoided, because conflicts can arise over which of the real router or the virtual router should respond to ARPs and other requests directed at the VIP. In any case, no backup router can have the same IP address as the VIP.

To signal that it is still in service, the master router sends MAC-level multicast “heartbeat” packets called *advertisements* to the LAN segment, using the IP multicast address **224.0.0.18**, using **port 112** (VRRP’s well-known port). These advertisements confirm the health of the master to backup routers in the cluster, and contain other VRRP information, such as the master’s priority.

If the master fails to send advertisements for some interval (the “Master is Dead” timer), the master is considered out of service, and the VRRP process triggers failover to the backup router. In this case, the backup router with the highest priority value becomes the new master router.

The advertise interval on the master router is typically one-third of the Master is Dead timer on the backup router(s).

Each VRRP router can be configured with a priority between 1 and 255. The router with the highest priority is elected as the master router of the VRRP cluster.

The VRRP standard (RFC 2338) specifies that a router owning the virtual IP should be assigned a priority of 255, which automatically elects the router owning the VIP as master. If you configure a VIP that is the real IP address of an interface on a router, you must set the priority of that router as 255. In any case, the priority of the master router is typically set to 255.

The backup router can be left with the default priority. However, if you have more than one backup router, you should set different priorities to ensure election occurs correctly when required.

The VRRP advertisements sent out by the master router include the master router's priority. If preemption is enabled, a backup router with a higher priority than the current master will "preempt" the master, and become the master itself. This might occur, for example, if a new backup router is brought online, while a lower-priority backup is acting as master.

A backup router preempts the master by beginning to send out its own VRRP advertisements. The master router examines these, and discovers that the backup router has a higher priority than itself. The master then stops sending out advertisements, while the backup continues to send, thus making itself the new master.

## Chapter 15: NAT

This chapter lists the commands for setting up NAT on the Vyatta OFR.

This chapter contains the following commands.

Command	Mode	Description
<code>clear nat counters</code>	Operational	Resets counters for active NAT rules.
<code>clear nat translations</code>	Operational	Clears state information associated with the specified NAT rule(s).
<code>service nat</code>	Configuration	Configures NAT on the router.
<code>show nat rules</code>	Operational	Lists configured NAT rules.
<code>show nat statistics</code>	Operational	Displays statistics for NAT.

# clear nat counters

Resets counters for active NAT rules.

---

## Command Mode

Operational mode.

---

## Syntax

```
clear nat counters
```

---

## Parameters

None.

---

## Usage Guidelines

Use this command to reset counters for NAT translation rules. Counters are reset for all rules.

# clear nat translations

Clears state information associated with the specified NAT rule(s).

---

## Command Mode

Operational mode.

---

## Syntax

```
clear nat translations
```

---

## Parameters

None.

---

## Usage Guidelines

Use this rule to clear state information associated with all NAT rules.

## service nat

Configures NAT on the router.

---

### Command Mode

Configuration mode.

---

### Syntax

`set service nat ...`

Use **set** to create the **nat** configuration node or modify NAT configuration.

Note that you cannot use **set** to change the number of a NAT rule, as it is the identifier of a configuration node. To change the number of a NAT rule, delete the rule and create it again with the correct number.

`delete service nat ...`

Use **delete** to delete a NAT rule or one of a rule's subordinate configuration nodes, or to delete the **nat** configuration node altogether.

---

### Configuration Statement

```
service {
  nat {
    rule: 1-1024 {
      type: [source|destination]
      translation-type: [static|dynamic|masquerade]
      inbound-interface: text
      outbound-interface: text
      protocols: [tcp|udp|icmp|all]
      source {
        address: ipv4
        network: ipv4net
        port-number: 1-4294967296 {}
        port-name: [http|ftp|smtp|telnet|ssh|dns|snmp] {}
        port-range {
          start: 1-4294967296
          stop: 1-4294967296
        }
      }
    }
    destination {
      address: ipv4
      network: ipv4net
    }
  }
}
```

```

    port-number: 1-4294967296 {}
    port-name: [http|ftp|smtp|telnet|ssh|dns|snmp] {}
    port-range {
        start: 1-4294967296
        stop: 1-4294967296
    }
    inside-address {
        address: ipv4
        network: ipv4net
    }
    outside-address {
        address: ipv4
        network: ipv4net
        range {
            start: ipv4
            stop: ipv4
        }
    }
}
}
}
}
}

```

## Parameters

<b>rule</b>	<p>Mandatory. Multi-node. A numeric identifier for the rule. The range is 1–1024.</p> <p>Note that in the current implementation, the table of NAT rules is not sorted numerically. NAT rules are evaluated <i>in the sequence in which they were configured</i>, regardless of the rule number. (This is different from the firewall feature, where rules are evaluated in sequence according to rule number.)</p>
<b>type</b>	<p>Mandatory. Indicates whether this rule is translating the source IP or the destination IP. Note that this is dependent on the direction of the interface. The supported values are as follows:</p> <p><b>source:</b> This rule translates the source network address. Typically “source” rules are applied to outbound packets.</p> <p><b>destination:</b> This rule translates the destination network address. Typically “destination” rules are applied to inbound packets.</p>

---

<b>translation-type</b>	<p>Mandatory. Specifies whether the rule will apply static mapping, dynamic many-to-one mapping, or masquerade mapping. Supported values are as follows:</p> <p><b>static:</b> The rule applies one-to-one static mapping.</p> <p><b>dynamic:</b> The rule applies dynamic many-to-one mapping.</p> <p><b>masquerade:</b> The rule uses a router interface IP address for source NAT only.</p>
<b>inbound-interface</b>	<p>Mandatory for destination NAT. The inbound Ethernet or serial interface. Destination NAT (DNAT) translation will be performed on traffic received on this interface.</p> <p>You can specify an individual vif, rather than an entire interface. To do this, refer to the vif using <i>int.vif</i> notation. For example to refer to vif 40 on interface eth0, use <b>eth0.40</b>.</p>
<b>outbound-interface</b>	<p>Mandatory for source NAT. The outbound Ethernet or serial interface. Source NAT (SNAT) translation will be performed on traffic transmitted from this interface.</p> <p>You can specify an individual vif, rather than an entire interface. To do this, refer to the vif using <i>int.vif</i> notation. For example to refer to vif 40 on interface eth0, use <b>eth0.40</b>.</p>
<b>protocols</b>	<p>Optional. The protocols on which to perform NAT. Supported values are as follows:</p> <p><b>tcp:</b> Performs NAT on TCP traffic only.</p> <p><b>udp:</b> Performs NAT on UDP traffic only.</p> <p><b>icmp:</b> Performs NAT on ICMP traffic only.</p> <p><b>all:</b> Performs NAT on all protocol traffic.</p> <p>The default is <b>all</b>.</p>
<b>source</b>	<p>Optional. Defines the source for this NAT rule.</p> <ul style="list-style-type: none"> <li>Source addresses are defined by specifying just one of <b>address</b> or <b>network</b>.</li> <li>Source ports can only be defined when the specified protocol is TCP or UDP. Source ports are defined by specifying just one of <b>port-number</b>, <b>port-name</b>, or <b>port-range</b>.</li> </ul>

---

<b>address</b>	<p>Mandatory. The IP address to be included as the “source” address in the IP header.</p> <ul style="list-style-type: none"> <li>For source NAT, this will be the “inside” (private) IP address or subnet.</li> <li>For destination NAT this will be the “outside” (public) IP address or subnet.</li> </ul>
<b>network</b>	<p>The source network. The format is <i>ip-address/prefix</i>. The default is “any,” which is represented as <b>0/0</b>.</p>
<b>port-number</b>	<p>Specifies a port by number (for example, port <b>80</b>). The range is 0 to 65535.</p>
<b>port-name</b>	<p>Specifies a port using the protocol literal. The following protocol literals are supported:</p> <ul style="list-style-type: none"> <li><b>http</b> (maps to port 80)</li> <li><b>ftp</b> (maps to port 20 and 21)</li> <li><b>smtp</b> (maps to port 25)</li> <li><b>telnet</b> (maps to port 23)</li> <li><b>ssh</b> (maps to port 22)</li> <li><b>dns</b> (maps to port 53)</li> <li><b>snmp</b> (maps to port 161)</li> </ul>
<b>port-range</b>	<p>Defines a range of consecutive ports for the source. The range is 1 to 4294967296.</p>
<b>start</b>	<p>Mandatory. The start port for the source port range. The range is 1 to 4294967296, where <b>start</b> must be lower than <b>stop</b>.</p>
<b>stop</b>	<p>Mandatory. The stop port for the source port range. The range is 1 to 4294967296, where <b>start</b> must be lower than <b>stop</b>.</p>
<b>destination</b>	<p>Optional. Defines the destination for this NAT rule.</p> <ul style="list-style-type: none"> <li>Destination addresses are defined by specifying just one of <b>address</b> or <b>network</b>.</li> <li>Destination ports can only be defined when the specified protocol is TCP or UDP. Source ports are defined by specifying just one of <b>port-number</b>, <b>port-name</b>, or <b>port-range</b>.</li> </ul>

<b>network</b>	The destination network. The format is <i>ip-address/prefix</i> , where <i>ip-address</i> is an IP address and <i>prefix</i> is a number from 0 to 32.
<b>address</b>	The destination IPv4 address.  When you have an inbound destination static NAT when traffic comes to the
<b>port-number</b>	Specifies a port by number (for example, port <b>80</b> ). The range is 0 to 65535.
<b>port-name</b>	Specifies a port using the protocol literal. The following protocol literals are supported: <ul style="list-style-type: none"> <li>• <b>http</b> (maps to port 80)</li> <li>• <b>ftp</b> (maps to port 20 and 21)</li> <li>• <b>smtp</b> (maps to port 25)</li> <li>• <b>telnet</b> (maps to port 23)</li> <li>• <b>ssh</b> (maps to port 22)</li> <li>• <b>dns</b> (maps to port 53)</li> <li>• <b>snmp</b> (maps to port 161)</li> </ul>
<b>port-range</b>	Defines a range of consecutive ports.
<b>start</b>	Mandatory. The start port for the destination port range. The range is 1 to 4294967296, where <b>start</b> must be lower than <b>stop</b> .
<b>stop</b>	Mandatory. The stop port for the destination port range. The range is 1 to 4294967296, where <b>start</b> must be lower than <b>stop</b> .
<b>inside-address</b>	Defines the “inside” IP address for destination NAT rules with a translation type of <b>static</b> .  Mandatory for destination NAT rules with a translation type of <b>static</b> . Forbidden otherwise.  Destination rules ingress from the untrusted to the trusted network. For static NAT rules, the inside address defines the IP address of the host on the trusted network. This is the address that will be substituted for the original destination IP address on packets sent to the OFR.
<b>address</b>	An IP address.
<b>network</b>	A network. The format is <i>ip-address/prefix</i> ., where <i>ip-address</i> is an IP address and <i>prefix</i> is a number from 0 to 32.

<b>outside-address</b>	Defines the “outside” IP address for source NAT rules with a translation type of <b>static</b> or <b>dynamic</b> .  Mandatory for source NAT rules with a translation type of <b>static</b> or <b>dynamic</b> . Forbidden otherwise.
<b>address</b>	An IP address.
<b>network</b>	A network. The format is <i>ip-address/prefix</i> , where <i>ip-address</i> is an IP address and <i>prefix</i> is a number from 0 to 32.
<b>range</b>	Defines a range of consecutive IP addresses. Make sure the “start” address is lower than the “stop” address.
<b>start</b>	Mandatory. The start address.
<b>stop</b>	Mandatory. The stop address.

## Usage Guidelines

Use this command to configure NAT.

In this release, you must create explicit NAT rules for each direction of traffic. For example, if you configure a one-to-one static source NAT rule and you want inbound traffic to match the NAT rule, you must explicitly create a matching destination NAT rule.

Source rules egress from the trusted to the untrusted network. For static and dynamic source NAT rules, the outside address defines the IP address that faces the untrusted network. This is the address that will be substituted in for the original source IP address in packets egressing to the untrusted network.

The “source” and “destination” attributes are relative to the interface they are applied to. For example, an outbound interface will process traffic as it leaves the interface. If the type of its rule is “source,” it will change the source IP address.

An outside address is not required for source rules with a translation type of **masquerade**, because for masquerade source rules the original source IP address is replaced with the IP address of the outbound interface. In fact, if you configure a source NAT rule with a translation type of masquerade, you cannot define the outside IP address, because the system uses the primary address of the outbound interface. If you want to use one of the other IP addresses you have assigned to the interface, change the type from **masquerade** to **dynamic**. Then you will be able to define an outside address.

The NAT configuration structure does not currently support port rewriting (for example, where packets destined for port 80 are rewritten to be destined for 8080).

## show nat rules

Lists configured NAT rules.

---

### Command Mode

Operational mode.

---

### Syntax

```
show nat rules [dynamic|static]
```

---

### Parameters

<b>dynamic</b>	Displays only dynamic NAT rules.
<b>static</b>	Displays only static NAT rules.

---

### Usage Guidelines

Use this command to display the NAT rules you have configured. You can use this command for troubleshooting, to confirm whether traffic is matching the NAT rules as expected.

When used with no option, this command displays all rules in the NAT rule table. Otherwise, you can choose to display just dynamic NAT or just static NAT rules.

# show nat statistics

Displays statistics for NAT.

---

## Command Mode

Operational mode.

---

## Syntax

```
show nat statistics
```

---

## Parameters

None.

---

## Usage Guidelines

Use this command to display current statistics for NAT.

## Chapter 16: Firewall

This chapter lists the commands for setting up firewall functionality on the Vyatta OFR.

This chapter contains the following commands.

Command	Mode	Description
<code>clear firewall name counters</code>	Operational	Clears all statistics associated with the specified firewall rule set.
<code>firewall</code>	Configuration	Configures a firewall instance (a named rule set) to use in packet filtering.
<code>interfaces ethernet firewall</code>	Configuration	Applies named firewall instances (packet-filtering rule sets) to an Ethernet interface.
<code>interfaces ethernet vif firewall</code>	Configuration	Applies named firewall instances (packet-filtering rule sets) to a virtual interface.
<code>interfaces serial cisco-hdlc vif firewall</code>	Configuration	Applies named firewall instances (packet-filtering rule sets) to a Cisco HDLC-encapsulated serial interface.
<code>interfaces serial frame-relay vif firewall</code>	Configuration	Applies named firewall instances (packet-filtering rule sets) to a Frame Relay-encapsulated serial interface.
<code>interfaces serial ppp vif firewall</code>	Configuration	Applies named firewall instances (packet-filtering rule sets) to a Point-to-Point Protocol-encapsulated serial interface.
<code>show firewall</code>	Operational	Shows the list of rules associated with a specific firewall instance.

## clear firewall name counters

Clears all statistics associated with the specified firewall rule set.

---

### Command Mode

Operational mode.

---

### Syntax

```
clear firewall name firewall-name counters
```

---

### Parameters

<i>firewall-name</i>	The name of the firewall rule set where statistics are to be cleared.
----------------------	---

---

### Usage Guidelines

Use this command to clear the statistics associated with a specific firewall rule set.

# firewall

Configures a firewall instance (a named rule set) to use in packet filtering.

---

## Command Mode

Configuration mode.

---

## Syntax

`set firewall ...`

Use **set** to create the **firewall** configuration node, or to modify the configuration of a firewall rule set.

Note that you cannot use **set** to change the identifier of a configuration node. Specifically, you cannot use **set** to change the number of a firewall rule. To change the number of a firewall rule, delete the rule and create it again with the correct identifier.

`delete firewall ...`

Use **delete** to delete a firewall rule set or one of a rule set's subordinate configuration nodes, or to delete the **firewall** configuration node altogether.

---

## Configuration Statement

```
firewall {
  log-martians: [enable|disable]
  send-redirects: [enable|disable]
  receive-redirects: [enable|disable]
  ip-src-route: [enable|disable]
  broadcast-ping: [enable|disable]
  syn-cookies: [enable|disable]
  name: text {
    description: text
    rule: 1-1024 {
      protocol: [all|tcp|udp|icmp|igmp|ipencap|gre|esp|ah|
        ospf|pim|vrrp]
      icmp {
        type: text {
          code: text
        }
      }
      state {
        established: [enable|disable]
        new: [enable|disable]
        related: [enable|disable]
        invalid: [enable|disable]
      }
    }
  }
}
```

```

    }
    action: [accept|drop|reject]
    log: [enable|disable]
    source {
        address: ipv4
        network: ipv4net
        range {
            start: ipv4
            stop: ipv4
        }
        port-number: 1-65535
        port-name: [http|ftp|smtp|telnet|ssh|dns|snmp]
        port-range {
            start: 1-65535
            stop: 1-65535
        }
    }
    destination {
        address: ipv4
        network: ipv4net
        range {
            start: ipv4
            stop: ipv4
        }
        port-number: 1-65535
        port-name: [http|ftp|smtp|telnet|ssh|dns|snmp]
        port-range {
            start: 1-65535
            stop: 1-65535
        }
    }
}
}
}

```

## Parameters

<b>log-martians</b>	<p>Optional. Directs whether to log packets with impossible addresses. Supported values are as follows:</p> <p><b>enable:</b> Records packets with impossible addresses in the log.</p> <p><b>disable:</b> Does not record packets with impossible addresses in the log.</p> <p>The default is <b>enable</b>.</p>
---------------------	---

---

<b>send-redirects</b>	<p>Optional. Directs whether to allow sending of ICMP redirects. Sending a redirect will potentially alter the routing table of the host or router to which the redirect is sent. Supported values are as follows:</p> <p><b>enable:</b> Allows ICMP redirects to be sent.</p> <p><b>disable:</b> Does not allow ICMP redirects to be sent.</p> <p>The default is <b>disable</b>.</p>
<b>receive-redirects</b>	<p>Optional. Directs whether to accept ICMP redirects. ICMP redirects can allow an arbitrary sender to forge packets and alter the router's routing table. This can leave the router open to a man-in-the-middle attack. Supported values are as follows:</p> <p><b>enable:</b> Permits packets with ICMP redirects.</p> <p><b>disable:</b> Denies packets with ICMP redirects.</p> <p>The default is <b>disable</b>.</p>
<b>ip-src-route</b>	<p>Optional. Directs whether to permit or deny packets with the Loose Source Route or Strict Source Route IP options.</p> <p>Source routing allows applications to override the routing tables and specify one or more intermediate destinations for outgoing datagrams. This capability is sometimes used for troubleshooting, but renders the network vulnerable to attacks where network traffic is transparently directed to a centralized collection point for packet capture.</p> <p>Supported values are as follows:</p> <p><b>enable:</b> Permits packets with source routing IP options set.</p> <p><b>disable:</b> Drops packets with source routing IP options set.</p> <p>The default is <b>disable</b>.</p>
<b>broadcast-ping</b>	<p>Optional. Directs whether the router will respond to ICMP Echo request messages sent to an IP broadcast address.</p> <p>Supported values are as follows:</p> <p><b>enable:</b> The router will respond to ICMP Echo requests sent to the broadcast address.</p> <p><b>disable:</b> The router will ignore ICMP Echo requests sent to the broadcast address.</p> <p>The default is <b>disable</b>.</p>

---

---

<b>syn-cookies</b>	<p>Optional. Enabling this option can help protect the router from a TCP SYN Flood Denial of Service (DoS) attack.</p> <p>To start a TCP connection, a source sends a SYN (synchronize/start) packet. The destination sends back a SYN ACK (synchronize acknowledge). Then the source sends an ACK (acknowledge), and the connection is established. This is referred to as the “TCP three-way handshake.”</p> <p>After a destination server sends a SYN ACK, it uses a connection queue to keep track of the connections waiting to be completed. An attacker can fill up the connection queue by generating phony TCP SYN packets from random IP addresses at a rapid rate. When the connection queue is full, all subsequent TCP services are denied.</p> <p>When this option is enabled, the router creates a hash entry when it receives a SYN packet, and returns a SYN ACK cookie only, without retaining all the SYN information. When it receives the ACK from the client, it validates it against the hash and, if it is valid, rebuilds the SYN packet information and accepts the packet.</p> <p><b>enable:</b> Enables TCP SYN cookies option.</p> <p><b>disable:</b> Disables TCP SYN cookies option.</p> <p>The default is <b>enable</b>.</p>
<b>name</b>	The name of this firewall instance. A firewall instance consists of a rule set of up to 1024 rules. Following the 1024 configurable rules is an implicit “deny all” rule.
<b>description</b>	A brief description for this firewall instance. If the description contains spaces, enclose it in double quotes.
<b>rule</b>	<p>Mandatory. Defines a firewall rule within the rule set. The argument is the rule number, which specifies the order in which this rule appears in the firewall rule table. The range is 1 to 1024.</p> <p>Each rule must have a unique rule number.</p> <p>Note that rules are evaluated in sequence according to rule number. This is different from the NAT feature, where rules are evaluated in the order in which they were configured, regardless of rule number.</p> <p>Note that after the final user-defined rule is executed, an implicit rule of <b>deny all</b> takes effect.</p>

---

<b>protocol</b>	<p>Optional. Defines the protocol to which the firewall rule applies. Packets using this protocol will “match” the rule.</p> <p><b>Note:</b> The protocol must be specified for the source or the destination, but not both.</p> <p>Supported values are as follows:</p> <p><b>all:</b> This rule applies to packets of all protocols.</p> <p><b>tcp:</b> This rule applies to TCP packets only.</p> <p><b>udp:</b> This rule applies to UDP packets only.</p> <p><b>icmp:</b> This rule applies to ICMP packets only.</p> <p><b>igmp:</b> This rule applies to IGMP packets only.</p> <p><b>ipencap:</b> This rule applies to IP-in-IP packets only.</p> <p><b>gre:</b> This rule applies to GRE packets only.</p> <p><b>esp:</b> This rule applies to ESP packets only.</p> <p><b>ah:</b> This rule applies to AH packets only.</p> <p><b>ospf:</b> This rule applies to OSPF packets only.</p> <p><b>pim:</b> This rule applies to PIM packets only.</p> <p><b>vrrp:</b> This rule applies to VRRP packets only.</p> <p>The default is <b>all</b>.</p>
<b>icmp</b>	<p>Optional. Defines the ICMP types this packet applies to—for example Echo Request or Echo Reply. Packets having this ICMP type will “match” the rule.</p>
<b>type</b>	<p>Mandatory. A valid ICMP type code from 0 to 255; for example, <b>8</b> (Echo Request), or <b>0</b> (Echo Reply), or the keyword <b>all</b>.</p> <p>The default is <b>all</b>.</p> <p>For a list of ICMP codes and types, see “Appendix A: ICMP Types.”</p>
<b>code</b>	<p>Optional. The ICMP type code associated with this ICMP type. The range is 0 to 255.</p> <p>For a list of ICMP codes and types, see “Appendix A: ICMP Types.”</p>
<b>state</b>	<p>Specifies the kind of packets this rule will be applied to. You can enable multiple states.</p>

---

<b>established</b>	<p>This rule will be applied to packets that are part of a connection that has seen packets in both directions (for example, a reply packet, or an outgoing packet on a connection that has been replied to). Supported values are as follows:</p> <p><b>enable:</b> Allow packets that are part of an established connection.</p> <p><b>disable:</b> Block packets that are part of an established connection.</p> <p>The default is <b>disable</b>.</p>
<b>new</b>	<p>This rule will be applied to packets creating new connections. For TCP, this will be packets with the SYN flag set. Supported values are as follows:</p> <p><b>enable:</b> Allow packets that are part of a new connection.</p> <p><b>disable:</b> Block packets that are part of a new connection.</p> <p>The default is <b>disable</b>.</p>
<b>related</b>	<p>This rule will be applied to a packet that is related to, but not part of, an existing connection, such as an ICMP error. Supported values are as follows:</p> <p><b>enable:</b> Allow packets that are part of a related connection.</p> <p><b>disable:</b> Block packets that are part of a related connection.</p> <p>The default is <b>disable</b>.</p>
<b>invalid</b>	<p>This rule will be applied to packets that could not be identified for some reason. These might include the router running out of resource, or ICMP errors that do not correspond to any known connection. Generally these packets should be dropped. Supported values are as follows:</p> <p><b>enable:</b> Allow packets that are part of an invalid connection.</p> <p><b>disable:</b> Block packets that are part of an invalid connection.</p> <p>The default is <b>disable</b>.</p>
<b>action</b>	<p>Mandatory. The action to perform on packets that match the criteria specified in this firewall rule. Only one action can be defined for a rule. Supported values are as follows:</p> <p><b>accept:</b> Accepts and forwards packets matching the criteria.</p> <p><b>drop:</b> Silently drops packets matching the criteria.</p> <p><b>reject:</b> Drops packets matching the criteria with a TCP reset.</p>

---

<b>log</b>	Any actions taken will be logged. Supported values are as follows: <b>enable:</b> Log when action is taken. <b>disable:</b> Do not log when action is taken. The default is <b>disable</b> .
<b>source</b>	Optional. Defines the source for this firewall rule. <ul style="list-style-type: none"><li>Source addresses are defined by specifying just one of <b>address</b>, <b>network</b>, or <b>range</b>.</li><li>Source ports can only be defined when the specified protocol is TCP or UDP. Source ports are defined by specifying just one of <b>port-number</b>, <b>port-name</b>, or <b>port-range</b>.</li></ul>
<b>address</b>	An IPv4 address.
<b>network</b>	The source network. The format is <i>ip-address/prefix</i> . The default is “any,” which is represented as <b>0/0</b> .
<b>range</b>	Defines a range of contiguous addresses for the source.
<b>start</b>	Mandatory. The start address for the source address range.
<b>stop</b>	Mandatory. The stop address for the source address range.
<b>port-number</b>	Specifies a port by number (for example, port <b>80</b> ).
<b>port-name</b>	Specifies a port using the protocol literal. The following protocol literals are supported: <ul style="list-style-type: none"><li><b>http</b> (maps to port 80)</li><li><b>ftp</b> (maps to port 20 and 21)</li><li><b>smtp</b> (maps to port 25)</li><li><b>telnet</b> (maps to port 23)</li><li><b>ssh</b> (maps to port 22)</li><li><b>dns</b> (maps to port 53)</li><li><b>snmp</b> (maps to port 161)</li></ul> You can specify more than one protocol using a comma-separated list, for example <b>http,ssh,telnet</b> .
<b>port-range</b>	Defines a range of consecutive ports for the source. The range is 0 to 65535.
<b>start</b>	Mandatory. The start port for the source port range. The range is 1 to 65535, where <b>start</b> must be a lower port number than <b>stop</b> .

<b>stop</b>	Mandatory. The stop port for the source port range. The range is 1 to 65535, where <b>start</b> must be a lower port number than <b>stop</b> .
<b>destination</b>	<p>Defines the destination for this firewall rule.</p> <ul style="list-style-type: none"> <li>Destination addresses are defined by specifying just one of <b>address</b>, <b>network</b>, or <b>range</b>.</li> <li>Destination ports can only be defined when the specified protocol is TCP or UDP. Destination ports are defined by specifying just one of <b>port-number</b>, <b>port-name</b>, or <b>port-range</b>.</li> </ul>
<b>address</b>	The destination IPv4 address.
<b>network</b>	Defines the destination network. The format is <i>ip-address/prefix</i> . The default is “any”, which is represented as 0/0.
<b>range</b>	Defines a range of contiguous addresses as the destination.
<b>start</b>	Mandatory. The start address for the destination address range.
<b>stop</b>	Mandatory. The stop address for the destination address range.
<b>port-number</b>	Specifies a port by number (for example, port <b>80</b> ).
<b>port-name</b>	<p>Specifies a port using the protocol literal. The following protocol literals are supported:</p> <ul style="list-style-type: none"> <li><b>http</b> (maps to port 80)</li> <li><b>ftp</b> (maps to port 20 and 21)</li> <li><b>smtp</b> (maps to port 25)</li> <li><b>telnet</b> (maps to port 23)</li> <li><b>ssh</b> (maps to port 22)</li> <li><b>dns</b> (maps to port 53)</li> <li><b>snmp</b> (maps to port 161)</li> </ul> <p>You can specify more than one protocol using a comma-separated list, for example <b>http,ssh,telnet</b>.</p>
<b>port-range</b>	Defines a range of consecutive ports.
<b>start</b>	Mandatory. The start port for the destination port range. The range is 1 to 65535, where <b>start</b> must be a lower port number than <b>stop</b> .
<b>stop</b>	Mandatory. The stop port for the destination port range. The range is 1 to 65535, where <b>start</b> must be a lower port number than <b>stop</b> .

---

## Usage Guidelines

Use this command to configure firewall.

A firewall has no effect on traffic traversing the router or destined to the router until it has been applied to an interface using the **interfaces ethernet firewall** command (see page 333).

Note that after the final user-defined rule is executed, an implicit rule of “deny all” takes effect.

## interfaces ethernet firewall

Applies named firewall instances (packet-filtering rule sets) to an Ethernet interface.

A firewall has no effect on traffic traversing the router or destined to the router until it has been applied to an interface or a vif using this command.

---

### Command Mode

Configuration mode.

---

### Syntax

`set interfaces ethernet name firewall ...` Use **set** to specify the rule sets to be applied to an Ethernet interface.

`delete interfaces ethernet name firewall ...` Use **delete** to remove a packet filter (or all packet filters) from an interface.

---

### Configuration Statement

```
interfaces {
  ethernet [eth0..eth23] {
    firewall {
      in {
        name: text
      }
      out {
        name: text
      }
      local {
        name: text
      }
    }
  }
}
```

---

### Parameters

---

<b>interface</b>	The Ethernet interface you are configuring: one of <b>eth0</b> through <b>eth23</b> . The interface must already have been defined.
------------------	---

---

---

<b>firewall</b>	Applies a named firewall rule set to the interface. One rule set can be applied to each of the following: <ul style="list-style-type: none"> <li>• Inbound packets</li> <li>• Outbound packets</li> <li>• Packets destined for this router itself</li> </ul>
<b>in</b>	The specified rule set will be applied to packets entering this interface.
<b>name</b>	Applies the specified rule set to packets entering this interface.
<b>out</b>	The specified rule set will be applied to packets leaving this interface.
<b>name</b>	Applies the specified rule set to packets leaving this interface.
<b>local</b>	The specified rule set will be applied to packets destined for this router itself.
<b>name</b>	Applies the specified rule set to packets destined for this router.

---

## Usage Guidelines

Use this command to apply the rule set defined for a firewall instance to a vif.

A firewall has no effect on traffic traversing the router or destined to the router until it has been applied to an interface or a vif using this command.

To use the firewall feature, you define a firewall rule set as a named firewall instance, using the **firewall** command (see page 324). You then apply the firewall instance to interfaces and/or vifs using this statement or the **interfaces ethernet vif firewall** command (see page 335). Once applied, the instance acts as a packet filter.

The firewall instance will filter packets in one of the following ways, depending on what you specify when you apply it to the interface:

- **in.** If you apply the rule set as **in**, the firewall will filter packets entering the interface.
- **out.** If you apply the rule set as **out**, the firewall will filter packets leaving the interface.
- **local.** If you apply the rule set as **local**, the firewall will filter packets destined for this router itself.

For each interface, you can apply up to three firewall instances: one firewall **in** instance, one firewall **out** instance, and one firewall **local** instance.

Make sure the firewall instance you apply to an interface is already defined, or you may experience unintended results. If you apply a firewall instance that does not exist to an interface, the implicit firewall rule of **allow all** will be applied.

To define firewall rule sets, use the **firewall** command (see page 324).

## interfaces ethernet vif firewall

Applies named firewall instances (packet-filtering rule sets) to a virtual interface.

A firewall has no effect on traffic traversing the router or destined to the router until it has been applied to an interface or a vif.

---

### Command Mode

Configuration mode.

---

### Syntax

<code>set interfaces ethernet <i>name</i> vif <i>name</i> firewall ...</code>	Use <b>set</b> to specify the rule sets to be applied to a vif on an Ethernet interface.
<code>delete interfaces ethernet <i>name</i> vif <i>name</i> firewall ...</code>	Use <b>delete</b> to remove a packet filter (or all packet filters) from a virtual.

---

### Configuration Statement

```

interfaces {
  ethernet [eth0..eth23] {
    vif text {
      firewall {
        in {
          name: text
        }
        out {
          name: text
        }
        local {
          name: text
        }
      }
    }
  }
}

```

---

### Parameters

---

<b>ethernet</b>	The Ethernet interface you are configuring: one of <b>eth0</b> through <b>eth23</b> . The interface must already have been defined.
-----------------	---

---

<b>vif</b>	The vif you are configuring. The vif must already have been defined.
<b>firewall</b>	Applies a named firewall rule set to the vif. One rule set can be applied to each of the following: <ul style="list-style-type: none"> <li>• Inbound packets</li> <li>• Outbound packets</li> <li>• Packets destined for this router itself</li> </ul>
<b>in</b>	The specified rule set will be applied to packets entering this vif.
<b>name</b>	Applies the specified rule set to packets entering this vif.
<b>out</b>	The specified rule set will be applied to packets leaving this vif.
<b>name</b>	Applies the specified rule set to packets leaving this vif.
<b>local</b>	The specified rule set will be applied to packets destined for this router itself.
<b>name</b>	Applies the specified rule set to packets destined for this router.

## Usage Guidelines

Use this command to apply the rule set defined for a firewall instance to the vif of an Ethernet interface.

A firewall has no effect on traffic traversing the router or destined to the router until it has been applied to an interface or a vif.

To use the firewall feature, you define a firewall rule set as a named firewall instance, using the **firewall** command (see page 324). You then apply the firewall instance to interfaces and/or vifs using a statement like this one. Once applied, the instance acts as a packet filter.

The firewall instance will filter packets in one of the following ways, depending on what you specify when you apply it to the vif:

- **in.** If you apply the rule set as **in**, the firewall will filter packets entering the vif.
- **out.** If you apply the rule set as **out**, the firewall will filter packets leaving the vif.
- **local.** If you apply the rule set as **local**, the firewall will filter packets destined for this router itself.

For each vif, you can apply up to three firewall instances: one firewall **in** instance, one firewall **out** instance, and one firewall **local** instance.

Make sure the firewall instance you apply to a vif is already defined, or you may experience unintended results. If you apply a firewall instance that does not exist to vif, the implicit firewall rule of **allow all** will be applied.

To define firewall rule sets, use the **firewall** command (see page 324).

## interfaces serial cisco-hdlc vif firewall

Applies named firewall instances (packet-filtering rule sets) to a Cisco HDLC-encapsulated serial interface.

A firewall has no effect on traffic traversing the router or destined to the router until it has been applied to an interface or a vif.

---

### Command Mode

Configuration mode.

---

### Syntax

<code>set interfaces serial <i>name</i> cisco-hdlc vif <i>name</i> firewall ...</code>	Use <b>set</b> to specify the firewall rule sets to be applied to a Cisco HDLC-encapsulated serial interface.
<code>delete interfaces serial <i>name</i> cisco-hdlc vif <i>name</i> firewall ...</code>	Use <b>delete</b> to remove a packet filter (or all packet filters) from the vif configuration node of a Cisco HDLC-encapsulated serial interface.

---

### Configuration Statement

```
interfaces {  
  serial [wan0..wan9] {  
    vif 1 {  
      cisco-hdlc {  
        firewall {  
          in {  
            name: text  
          }  
          out {  
            name: text  
          }  
          local {  
            name: text  
          }  
        }  
      }  
    }  
  }  
}
```

---

## Parameters

<b>serial</b>	The serial interface you are configuring: one of <b>wan0</b> through <b>wan9</b> . The interface must already have been defined.
<b>vif</b>	The identifier of the virtual interface. Currently, only one vif is supported for Cisco HDLC interfaces, and the identifier must be <b>1</b> . The vif must already have been defined.
<b>cisco-hdlc</b>	Identifies this interface as a Cisco HDLC–encapsulated interface.
<b>firewall</b>	Applies a named firewall rule set to the interface. One rule set can be applied to each of the following: <ul style="list-style-type: none"> <li>• Inbound packets</li> <li>• Outbound packets</li> <li>• Packets destined for this router itself</li> </ul>
<b>in</b>	The specified rule set will be applied to packets entering this interface.
<b>name</b>	Applies the specified rule set to packets entering this interface.
<b>out</b>	The specified rule set will be applied to packets leaving this interface.
<b>name</b>	Applies the specified rule set to packets leaving this interface.
<b>local</b>	The specified rule set will be applied to packets destined for this router itself.
<b>name</b>	Applies the specified rule set to packets destined for this router.

---

## Usage Guidelines

Use this command to apply the rule set defined for a firewall instance to the vif of a Cisco HDLC–encapsulated serial interface.

A firewall has no effect on traffic traversing the router or destined to the router until it has been applied to an interface or a vif.

To use the firewall feature, you define a firewall rule set as a named firewall instance, using the **firewall** command (see page 324). You then apply the firewall instance to interfaces and/or vifs using this statement or one like it. Once applied, the instance acts as a packet filter.

The firewall instance will filter packets in one of the following ways, depending on what you specify when you apply it to the interface:

- **in.** If you apply the rule set as **in**, the firewall will filter packets entering the interface.
- **out.** If you apply the rule set as **out**, the firewall will filter packets leaving the interface.
- **local.** If you apply the rule set as **local**, the firewall will filter packets destined for this router itself.

For each interface, you can apply up to three firewall instances: one firewall **in** instance, one firewall **out** instance, and one firewall **local** instance.

Make sure the firewall instance you apply to an interface is already defined, or you may experience unintended results. If you apply a firewall instance that does not exist to an interface, the implicit firewall rule of **allow all** will be applied.

To define firewall rule sets, use the **firewall** command (see page 324).

## interfaces serial frame-relay vif firewall

Applies named firewall instances (packet-filtering rule sets) to a Frame Relay–encapsulated serial interface.

A firewall has no effect on traffic traversing the router or destined to the router until it has been applied to an interface or a vif.

---

### Command Mode

Configuration mode.

---

### Syntax

<pre>set interfaces serial <i>name</i>   frame-relay vif <i>name</i>   firewall ...</pre>	Use <b>set</b> to specify the firewall rule sets to be applied to a Frame Relay–encapsulated serial interface.
<pre>delete interfaces serial <i>name</i>   frame-relay vif <i>name</i>   firewall ...</pre>	Use <b>delete</b> to remove a packet filter (or all packet filters) from the vif configuration node of a Frame Relay–encapsulated serial interface.

---

### Configuration Statement

```
interfaces {
  serial [wan0..wan9] {
    vif 16-991 {
      frame-relay {
        firewall {
          in {
            name: text
          }
          out {
            name: text
          }
          local {
            name: text
          }
        }
      }
    }
  }
}
```

---

## Parameters

<b>serial</b>	The serial interface you are configuring: one of <b>wan0</b> through <b>wan9</b> . The interface must already have been defined.
<b>vif</b>	The identifier of the virtual interface. For Frame Relay interfaces, this is the DLCI number for the interface. The range is 16 to 991.  The vif must already have been defined.
<b>cisco-hdlc</b>	Identifies this interface as a Cisco HDLC–encapsulated interface.
<b>firewall</b>	Applies a named firewall rule set to the interface. One rule set can be applied to each of the following: <ul style="list-style-type: none"> <li>• Inbound packets</li> <li>• Outbound packets</li> <li>• Packets destined for this router itself</li> </ul>
<b>in</b>	The specified rule set will be applied to packets entering this interface.
<b>name</b>	Applies the specified rule set to packets entering this interface.
<b>out</b>	The specified rule set will be applied to packets leaving this interface.
<b>name</b>	Applies the specified rule set to packets leaving this interface.
<b>local</b>	The specified rule set will be applied to packets destined for this router itself.
<b>name</b>	Applies the specified rule set to packets destined for this router.

---

## Usage Guidelines

Use this command to apply the rule set defined for a firewall instance to the vif of a Frame Relay–encapsulated serial interface.

A firewall has no effect on traffic traversing the router or destined to the router until it has been applied to an interface or a vif.

To use the firewall feature, you define a firewall rule set as a named firewall instance, using the **firewall** command (see page 324). You then apply the firewall instance to interfaces and/or vifs using this statement or one like it. Once applied, the instance acts as a packet filter.

The firewall instance will filter packets in one of the following ways, depending on what you specify when you apply it to the interface:

- **in.** If you apply the rule set as **in**, the firewall will filter packets entering the interface.
- **out.** If you apply the rule set as **out**, the firewall will filter packets leaving the interface.
- **local.** If you apply the rule set as **local**, the firewall will filter packets destined for this router itself.

For each interface, you can apply up to three firewall instances: one firewall **in** instance, one firewall **out** instance, and one firewall **local** instance.

Make sure the firewall instance you apply to an interface is already defined, or you may experience unintended results. If you apply a firewall instance that does not exist to an interface, the implicit firewall rule of **allow all** will be applied.

To define firewall rule sets, use the **firewall** command (see page 324).

## interfaces serial ppp vif firewall

Applies named firewall instances (packet-filtering rule sets) to a Point-to-Point Protocol–encapsulated serial interface.

A firewall has no effect on traffic traversing the router or destined to the router until it has been applied to an interface or a vif.

---

### Command Mode

Configuration mode.

---

### Syntax

<code>set interfaces serial <i>name</i> ppp vif <i>name</i> firewall ...</code>	Use <b>set</b> to specify the firewall rule sets to be applied to a Point-to-Point Protocol–encapsulated serial interface.
<code>delete interfaces serial <i>name</i> ppp vif <i>name</i> firewall ...</code>	Use <b>delete</b> to remove a packet filter (or all packet filters) from the vif configuration node of a Point-to-Point Protocol–encapsulated serial interface.

---

### Configuration Statement

```
interfaces {  
  serial wan0..wan9 {  
    vif 1 {  
      ppp {  
        firewall {  
          in {  
            name: text  
          }  
          out {  
            name: text  
          }  
          local {  
            name: text  
          }  
        }  
      }  
    }  
  }  
}
```

---

## Parameters

<b>serial</b>	The serial interface you are configuring: one of <b>wan0</b> through <b>wan9</b> . The interface must already have been defined.
<b>vif</b>	The identifier of the virtual interface. Currently, only one vif is supported for point-to-point interfaces, and the identifier must be <b>1</b> . The vif must already have been defined.
<b>cisco-hdlc</b>	Identifies this interface as a Point-to-Point Protocol–encapsulated interface.
<b>firewall</b>	Applies a named firewall rule set to the interface. One rule set can be applied to each of the following: <ul style="list-style-type: none"> <li>• Inbound packets</li> <li>• Outbound packets</li> <li>• Packets destined for this router itself</li> </ul>
<b>in</b>	The specified rule set will be applied to packets entering this interface.
<b>name</b>	Applies the specified rule set to packets entering this interface.
<b>out</b>	The specified rule set will be applied to packets leaving this interface.
<b>name</b>	Applies the specified rule set to packets leaving this interface.
<b>local</b>	The specified rule set will be applied to packets destined for this router itself.
<b>name</b>	Applies the specified rule set to packets destined for this router.

---

## Usage Guidelines

Use this command to apply the rule set defined for a firewall instance to the vif of a Point-to-Point Protocol–encapsulated serial interface.

A firewall has no effect on traffic traversing the router or destined to the router until it has been applied to an interface or a vif.

To use the firewall feature, you define a firewall rule set as a named firewall instance, using the **firewall** command (see page 324). You then apply the firewall instance to interfaces and/or vifs using this statement or one like it. Once applied, the instance acts as a packet filter.

The firewall instance will filter packets in one of the following ways, depending on what you specify when you apply it to the interface:

- **in.** If you apply the rule set as **in**, the firewall will filter packets entering the interface.
- **out.** If you apply the rule set as **out**, the firewall will filter packets leaving the interface.
- **local.** If you apply the rule set as **local**, the firewall will filter packets destined for this router itself.

For each interface, you can apply up to three firewall instances: one firewall **in** instance, one firewall **out** instance, and one firewall **local** instance.

Make sure the firewall instance you apply to an interface is already defined, or you may experience unintended results. If you apply a firewall instance that does not exist to an interface, the implicit firewall rule of **allow all** will be applied.

To define firewall rule sets, use the **firewall** command (see page 324).

# show firewall

Shows the list of rules associated with a specific firewall instance.

---

## Command Mode

Operational mode.

---

## Syntax

```
show firewall rule-set [no-resolve |  
                        statistics |  
                        detail [rule rule-num]]
```

---

## Parameters

<i>rule-set</i>	The name of the firewall rule set.
<b>no-resolve</b>	Do not attempt to resolve IP addresses into domain names.  Use this option to reduce the amount of time it takes for this command to return a result.
<b>statistics</b>	Displays counters for the specified firewall rule set.
<b>detail</b>	Displays detailed information about the specified rule set.
<b>rule</b>	Displays detailed information about the specified individual rule.

---

## Usage Guidelines

Use this command to display the rules associated with a specific firewall rule set.

When this command is used without the **no-resolve** option, the router will attempt to resolve all IP addresses in the configuration to DNS names. This can significantly increase the amount of time required for the command to return a result. To minimize the delay, use the **no-resolve** option.

The **statistics** option displays the current values of all counters associated with the specified firewall rule set.

## Chapter 17: IPsec VPN

This chapter lists the commands for setting up IPsec VPN on the Vyatta OFR.

This chapter contains the following commands.

Command	Mode	Description
<code>show vpn debug</code>	Operational	Provides trace-level information about IPsec VPN.
<code>show vpn ike sa</code>	Operational	Provides information about all currently active ISAKMP security associations.
<code>show vpn ike status</code>	Operational	Displays summary information about the IKE process.
<code>show vpn ipsec sa</code>	Operational	Provides information about all active IPsec security associations.
<code>show vpn ipsec sa statistics</code>	Operational	Display information about active tunnels that have an IPsec security association (SA).
<code>show vpn ipsec status</code>	Operational	Displays information about the status of IPsec processes.
<code>vpn ipsec</code>	Configuration	Creates the top-most configuration node for IPsec VPN, enabling IPsec VPN functionality.
<code>vpn ipsec esp-group</code>	Configuration	Defines a named ESP configuration that can be used in IKE Phase 2 negotiations.
<code>vpn ipsec ike-group</code>	Configuration	Creates a named IKE configuration that can be used in IKE Phase 1 negotiations.
<code>vpn ipsec ipsec-interfaces</code>	Configuration	Enables IPsec VPN on a router interface.
<code>vpn ipsec logging</code>	Configuration	Allows you to specify logging levels, modes, and facilities for IPsec VPN.
<code>vpn ipsec nat-traversal</code>	Configuration	Determines whether the OFR announces NAT traversal capability.
<code>vpn ipsec site-to-site</code>	Configuration	Defines a site-to-site connection between the OFR and another VPN gateway.

# show vpn debug

Provides trace-level information about IPsec VPN.

---

## Command Mode

Operational mode.

---

## Syntax

```
show vpn debug [detail]
```

---

## Parameters

<b>detail</b>	Provides extra verbose output at the trace level.
---------------	---

---

## Usage Guidelines

Use this command to view trace-level messages for IPsec VPN.

This command is useful for troubleshooting and diagnostic situations.

---

## Examples

Example 17-3 shows the output of the **show vpn debug** command.

---

### Example 17-1 “show vpn debug” sample output

---

```
vyatta@WEST> show vpn debug
000 interface lo/lo ::1
000 interface lo/lo 127.0.0.1
000 interface eth0/eth0 10.1.0.55
000 interface eth1/eth1 10.6.0.55
000 %myid = (none)
000 debug none
000
000algorithmESPencrypt:id=2,name=ESP_DES,ivlen=8,keysize=64,keysize
max=64
000algorithmESPencrypt:id=3,name=ESP_3DES,ivlen=8,keysize=192,keysize
max=192
000algorithmESPencrypt:id=7,name=ESP_BLOWFISH,ivlen=8,keysize=40,keysize
max=448
000algorithmESPencrypt:id=11,name=ESP_NULL,ivlen=0,keysize=0,keysize
max=0
```

```

000algorithmESPencrypt:id=12,name=ESP_AES,ivlen=8,keysize=128,keysizemax=256
000algorithmESPencrypt:id=252,name=ESP_SERPENT,ivlen=8,keysize=128,keysizemax=256
000algorithmESPencrypt:id=253,name=ESP_TWOFISH,ivlen=8,keysize=128,keysizemax=256
000algorithmESPauthattr:id=1,name=AUTH_ALGORITHM_HMAC_MD5,keysize=128,keysizemax=128
--More--

```

---

Example 17-3 shows the output of the **show vpn debug detail** command.

---

**Example 17-2** “show vpn debug detail” sample output

---

```

vyatta@WEST> show vpn debug detail

## show vpn ike sa

Provides information about all currently active ISAKMP security associations.

---

### Command Mode

Operational mode.

---

### Syntax

```
show vpn ike sa
```

---

### Parameters

None.

---

### Usage Guidelines

Use this command to display information about IKE security associations (SAs).

This command displays a list of remote VPN peers and their current IKE status. The information shown includes:

- The IP addresses being used for IPsec on the local and remote VPN gateways
- The state of the connection
- The encryption cipher
- The hash algorithm
- The length of time the connection has been active
- The configured lifetime of the SA
- Whether NAT traversal is enabled

---

## Examples

Example 17-3 shows the output of the **show vpn ike sa** command.

Example 17-3 “show vpn ike sa” sample output

---

```
vyatta@WEST> show vpn ike sa
```

Local IP	Peer IP	State	Encrypt	Hash	Active	L-Time	NAT-T
-----	-----	-----	-----	-----	-----	-----	-----
10.6.0.55	10.6.0.57	up	aes128	sha1	454	28800	disab

```
vyatta@WEST>
```

---

# show vpn ike status

Displays summary information about the IKE process.

---

## Command Mode

Operational mode.

---

## Syntax

```
show vpn ike status
```

---

## Parameters

None

---

## Usage Guidelines

Use this command to see the status of the IKE process.

---

## Examples

Example 17-4 shows the output of the **show vpn ike status** command.

Example 17-4 “show vpn ike status” sample output

---

```
vyatta@west> show vpn ike status
IKE Process Running

PID: 5832

vyatta@west>
```

---

## show vpn ipsec sa

Provides information about all active IPsec security associations.

---

### Command Mode

Operational mode.

---

### Syntax

```
show vpn ipsec sa
```

---

### Parameters

None.

---

### Usage Guidelines

Use this command to display information about remote VPN peers and IPsec security associations (SAs) currently in effect.

The information shown includes:

- The IP address of the remote VPN gateway
- The direction of the SA
- The SPI of the connection
- The encryption cipher
- The hash algorithm
- The configured lifetime for the SA.

---

## Examples

Example 17-5 shows the output of the **show vpn ipsec sa** command.

Example 17-5 “show vpn ipsec sa” sample output

---

```
vyatta@WEST> show vpn ipsec sa
```

Peer IP	Dir	SPI	Encrypt	Hash	Active	Lifetime
-----	---	---	-----	----	-----	-----
10.6.0.57	in	bf8ea130	aes128	sha1	565	3600
10.6.0.57	out	5818d99e	aes128	sha1	565	3600

```
vyatta@WEST>
```

---

## show vpn ipsec sa statistics

Display information about active tunnels that have an IPsec security association (SA).

---

### Command Mode

Operational mode.

---

### Syntax

```
show vpn ipsec sa statistics
```

---

### Parameters

None

---

### Usage Guidelines

Use this command to see statistics for active tunnels with an IPsec security association (SA).

The information shown includes:

- The IP address of the remote VPN gateway
- The direction of the SA
- The address of the source network
- The address of the destination network
- The number of packets that have passed through this SA
- The number of bytes that have passed through this SA.

---

## Examples

Example 17-6 shows the output of the **show vpn ipsec sa statistics** command.

Example 17-6 “show vpn ipsec sa statistics” sample output

---

```
vyatta@WEST> show vpn ipsec sa statistics
Peer IP          Dir  SRC Network      DST Network      Bytes
-----
10.6.0.57        in   0.0.0.0/0        10.7.0.48/28    0(bytes)
10.6.0.57        out  10.7.0.48/28    0.0.0.0/0       0(bytes)

vyatta@WEST>
```

---

# show vpn ipsec status

Displays information about the status of IPsec processes.

---

## Command Mode

Operational mode.

---

## Syntax

```
show vpn ipsec status
```

---

## Parameters

None

---

## Usage Guidelines

Use this command to display information about the status about running IPsec processes.

The information shown includes:

- The process ID
- The number of active tunnels
- The interfaces configured for IPsec
- The IP addresses of interfaces configured for IPsec

---

## Examples

Example 17-7 shows the output of the **show vpn ipsec status** command.

Example 17-7 “show vpn ipsec status” sample output

---

```
vyatta@WEST> show vpn ipsec status
IPSec Process Running  PID: 5832

4 Active IPsec Tunnels

IPsec Interfaces:
  eth1      (10.6.0.55)

vyatta@WEST>
```

---

## vpn ipsec

Creates the top-most configuration node for IPsec VPN, enabling IPsec VPN functionality.

---

### Syntax

---

set vpn ipsec	Use <b>set</b> to create the <b>vpn ipsec</b> configuration node. This enables IPsec VPN functionality.
delete vpn ipsec	Use <b>delete</b> to delete the <b>vpn ipsec</b> configuration node. Deleting this node will delete all IPsec VPN configuration.

---

---

### Command Mode

Configuration mode.

---

### Configuration Statement

```
vpn {  
    ipsec  
}
```

---

### Parameters

None.

---

### Usage Guidelines

Use this statement to create the top-most configuration node for IPsec VPN. This enables IPsec VPN functionality on the Vyatta OFR.

To configure VPN connections, you must also enable IPsec VPN on each interface to be used for sending and receiving VPN traffic. To do this, use the **vpn ipsec ipsec-interfaces** command (see page 365).

**NOTE** *The sending and receiving of ICMP redirects is disabled when IPsec VPN is configured.*

## vpn ipsec esp-group

Defines a named ESP configuration that can be used in IKE Phase 2 negotiations.

---

### Syntax

---

set vpn ipsec esp-group <i>name</i> ...	Use to create a new named ESP configuration, or to change the values of ESP configuration parameters.
delete vpn ipsec esp-group <i>name</i> ...	Use to delete a named ESP configuration. Use to delete ESP parameter values, or to delete sub-nodes of <b>esp-group</b> .

---

---

### Command Mode

Configuration mode.

---

### Configuration Statement

```
vpn {  
  ipsec {  
    esp-group text {  
      proposal 1-65535 {  
        encryption: [aes128|aes256|3des]  
        hash: [sha1|md5]  
      }  
      lifetime: 30-86400  
    }  
  }  
}
```

---

### Parameters

---

<b>esp-group</b>	Multi-node. The name to be used to refer to the ESP configuration.  You can create multiple ESP configurations by creating multiple <b>esp-group</b> configuration nodes. At least one ESP configuration must be defined, for use in tunnel configuration.
------------------	--

---

---

<b>proposal</b>	<p>Mandatory. Multi-node. An integer uniquely identifying a proposal for this ESP configuration.</p> <p>You can define multiple proposals within a single ESP configuration by creating multiple <b>proposal</b> configuration nodes. Each must have a unique identifier.</p>
<b>encryption</b>	<p>Optional. The encryption cipher to be used in this proposal. Supported values are as follows:</p> <p><b>aes128</b>: Advanced Encryption Standard with a 128-bit key.</p> <p><b>aes256</b>: Advanced Encryption Standard with a 256-bit key.</p> <p><b>3des</b>: Triple-DES (Data Encryption Standard).</p> <p>The default is <b>aes128</b>.</p>
<b>hash</b>	<p>Optional. The hash algorithm to be used in this proposal. Supported values are as follows:</p> <p><b>sha1</b>: The SHA-1 variant of the Secure Hash Algorithm.</p> <p><b>md5</b>: Version 5 of the message digest algorithm.</p> <p>The default is <b>sha1</b>.</p>
<b>lifetime</b>	<p>Optional. The time, in seconds, that the key created by this proposal can persist before the next IKE negotiation is triggered.</p> <p>The range is 30 to 86400 (that is, 24 hours). The default is 3600.</p>

---

---

## Usage Guidelines

Use this command to set the parameters required in IKE Phase 2 proposals, and to set the lifetime of the resulting IPsec security association.

## vpn ipsec ike-group

Creates a named IKE configuration that can be used in IKE Phase 1 negotiations.

### Syntax

set vpn ipsec ike-group <i>name</i> ...	Use to create a new named IKE configuration, or to change values of IKE group parameters.
delete vpn ipsec ike-group <i>name</i> ...	Use to delete a named IKE configuration, or to delete IKE parameter values, or sub-nodes of <b>ike-group</b> . Note that you cannot delete mandatory parameters or sub-nodes.

### Command Mode

Configuration mode.

### Configuration Statement

```
vpn {
  ipsec {
    ike-group text{
      proposal: 1-65535 {
        encryption: [aes128|aes256|3des]
        hash: [sha1|md5]
        dh-group: [2|5]
      }
      lifetime: 30-86400
    }
  }
}
```

### Parameters

<b>ike-group</b>	Mandatory. Multi-node. The name to be used to refer to the ISAKMP security association.  You can create multiple IKE policies by creating multiple <b>ike-group</b> configuration nodes.
------------------	--

---

<b>proposal</b>	<p>Mandatory. Multi-node. An integer uniquely identifying an IKE proposal for this IKE policy.</p> <p>You can define multiple proposals within a single IKE policy by creating multiple <b>proposal</b> configuration nodes. Each must have a unique identifier.</p>
<b>encryption</b>	<p>Optional. The encryption cipher to be used in this IKE proposal. Supported values are as follows:</p> <p><b>aes128</b>: Advanced Encryption Standard with a 128-bit key.</p> <p><b>aes256</b>: Advanced Encryption Standard with a 256-bit key.</p> <p><b>3des</b>: Triple-DES.</p> <p>The default is <b>aes128</b>.</p>
<b>hash</b>	<p>Optional. The hash algorithm to be used in this IKE proposal. Supported values are as follows:</p> <p><b>sha1</b>: The SHA-1 variant of the Secure Hash Algorithm.</p> <p><b>md5</b>: Version 5 of the message digest algorithm.</p> <p>The default is <b>sha1</b>.</p>
<b>dh-group</b>	<p>Optional. The Oakley group to be used in Diffie-Hellman key exchanges. Supported values are as follows:</p> <p><b>2</b>: Oakley group 2 will be used in Diffie-Hellman key exchanges.</p> <p><b>5</b>: Oakley group 5 will be used in Diffie-Hellman key exchanges.</p>
<b>lifetime</b>	<p>Optional. The time, in seconds, that the key created by this proposal can persist before the next IKE negotiation is triggered.</p> <p>The range is 30 to 86400 (that is, 24 hours). The default is 28800.</p>

---

---

## Usage Guidelines

Use this command to set the parameters required in IKE Phase 1 proposals, and to specify the lifetime of the resulting ISAKMP security association.

## vpn ipsec ipsec-interfaces

Enables IPsec VPN on a router interface.

---

### Syntax

---

set vpn ipsec ipsec-interfaces interface *int* ... Use to enable IPsec VPN on an interface.

---

delete vpn ipsec ipsec-interfaces interface *int* Use to disable IPsec VPN on an interface.

...

Note that if you delete an interface in this way, site-to-site connections referencing this tunnel will no longer operate. If you attempt to enable a connection referencing the IP address of a deleted interface, an error will result.

---

---

### Command Mode

Configuration mode.

---

### Configuration Statement

```
vpn {  
  ipsec {  
    ipsec-interfaces {  
      interface int-name {}  
    }  
  }  
}
```

---

### Parameters

---

<b>interface</b>	Mandatory. Multi-node. The name of a network interface to be used for IPsec VPN. The network interface must already be created and configured.  You can enable IPsec VPN on more than one interface by creating multiple <b>ipsec-interfaces</b> configuration nodes.
------------------	---

---

---

### Usage Guidelines

Use this command to enable IPsec VPN on a network interface.

## vpn ipsec logging

Allows you to specify logging levels, modes, and facilities for IPsec VPN.

### Syntax

set vpn ipsec logging...	Use to define logging parameters for IPsec VPN.
delete vpn ipsec logging...	Use to delete logging parameter values.

### Command Mode

Configuration mode.

### Configuration Statement

```
vpn {
  ipsec {
    logging {
      facility: [daemon|local0..local7]
      level: [emerg|crit|err|warning|alert|notice|info|debug]
      log-modes [all|raw|crypt|parsing|emitting|control|
        private] {}
    }
  }
}
```

### Parameters

<b>facility</b>	<p>Optional, but if <b>facility</b> is set, then <b>level</b> must be set, and vice versa. The syslog facility to use for IPsec log messages. Supported values are as follows:</p> <p><b>daemon:</b> Use the OFR's internal VPN logging daemon for IPsec log messages.</p> <p><b>local0</b> to <b>local7:</b> Use the specified UNIX logging facility for IPsec log messages.</p> <p>There is no default.</p>
-----------------	---

<b>level</b>	Optional, but if <b>facility</b> is set, then <b>level</b> must be set, and vice versa. The syslog severity level to be used for IPsec log messages. Supported values are <b>emerg</b> , <b>alert</b> , <b>crit</b> , <b>err</b> , <b>warning</b> , <b>notice</b> , <b>info</b> , and <b>debug</b> . There is no default.
<b>log-mode</b>	Mandatory. Multi-node. The log mode to be used for IPsec log messages. Supported values are as follows: <b>all</b> : Enables all logging options. <b>raw</b> : Shows the raw bytes of messages. <b>crypt</b> : Shows the encryption and decryption of messages. <b>parsing</b> : Shows the structure of input messages. <b>emitting</b> : Shows the structure of output messages. <b>control</b> : Shows the decision-making process of the IKE daemon (Pluto). <b>private</b> : Allows debugging output with private keys. You can configure multiple log modes, by creating more than one <b>log-mode</b> configuration node.

## Usage Guidelines

Use this command to define logging options for IPsec VPN.

The IPsec process generates log messages during operation. You can direct the system to send IPsec log messages to syslog. The result will depend on how the system syslog is configured.

Keep in mind that in the current implementation, the main syslog file **/var/log/messages** reports only messages of severity **warning** and above, regardless of the severity level configured. If you want to configure a different level of severity for log messages (for example, if you want to see debug messages during troubleshooting), you must configure syslog to send messages into a different file, which you define within syslog.

Configuring log modes is optional. When a log mode is not configured, IPsec log messages consist mostly of IPsec startup and shutdown messages. The log modes allow you to direct the system to inspect the IPsec packets and report the results.

Note that some log modes (for example, **all** and **control**) generate several log messages per packet. Using any of these options may severely degrade system performance.

For information about configuring syslog, please refer to the **system syslog** command (see page 383).

VPN IPsec log messages use standard syslog levels of severity. For information on syslog severities, please see Table 19-1: “Syslog message severities” on page 386.

## vpn ipsec nat-traversal

Determines whether the OFR announces NAT traversal capability.

---

### Syntax

---

set vpn ipsec nat-traversal enable	Use to specify whether OFR announces NAT traversal support.
set vpn ipsec nat-traversal disable	
delete vpn ipsec nat-traversal	Use to delete NAT traversal configuration.

---

---

### Command Mode

Configuration mode.

---

### Configuration Statement

```
vpn {  
    ipsec {  
        nat-traversal: [enable|disable]  
    }  
}
```

---

### Parameters

---

<b>enable</b>	Enables NAT traversal.
<b>disable</b>	Disables NAT traversal. This is the default.

---

---

### Usage Guidelines

Use this command to direct the OFR to announce or not announce NAT traversal support. If the far-end gateway requests NAT-T, the OFR will use NAT-T regardless of the setting of this parameter.

## vpn ipsec site-to-site

Defines a site-to-site connection between the OFR and another VPN gateway.

---

### Syntax

---

set vpn ipsec site-to-site peer <i>ipv4</i> ...	Use to define a site-to-site tunnel and set tunnel characteristics.
---	---

---

delete vpn ipsec site-to-site peer <i>ipv4</i>	Use to delete tunnel configuration.
--	-------------------------------------

---

---

### Command Mode

Configuration mode.

---

### Configuration Statement

```
vpn {  
    ipsec {  
        site-to-site {  
            peer ipv4 {  
                authentication {  
                    pre-shared-secret: text  
                }  
                ike-group: text  
                local-ip: ipv4  
                tunnel:1-65535 {  
                    local-subnet: ipv4net  
                    remote-subnet: ipv4net  
                    esp-group: text  
                }  
            }  
        }  
    }  
}
```

---

## Parameters

<b>peer</b>	<p>Mandatory. Multi-node. The address of the far-end VPN gateway. The format is an IPv4 address, where host address <b>0.0.0.0</b> means any remote peer.</p> <p>You can define more than one VPN peer by creating multiple <b>peer</b> configuration nodes.</p>
<b>authentication</b>	<p>Mandatory. The authentication method to be used for this connection.</p>
<b>pre-shared-secret</b>	<p>Mandatory. The pre-shared secret to be used to authenticate the remote host.</p>
<b>ike-group</b>	<p>Mandatory. The named IKE configuration to be used for this connection. The IKE configuration must have already been defined, using the the <b>vpn ipsec ike-group</b> command (see page 363).</p>
<b>local-ip</b>	<p>Mandatory. The local IP address to be used as the source IP for packets destined for the remote peer. Please note that:</p> <ul style="list-style-type: none"> <li>• This IP address must already be configured on one of the router's interfaces, and</li> <li>• The interface must already have IPsec VPN enabled, using the the <b>vpn ipsec ipsec-interfaces</b> command (see page 365).</li> </ul>
<b>tunnel</b>	<p>Mandatory. Multi-node. An integer that uniquely identifies this tunnel configuration for this peer VPN gateway. Each tunnel corresponds to a distinct connection configuration.</p> <p>The range is 1 to 65535.</p> <p>A given VPN peer may have more than one tunnel configuration, but each peer must have at least one. To define more than one tunnel configuration for a peer, create multiple <b>tunnel</b> configuration nodes within the peer configuration.</p>
<b>local-subnet</b>	<p>Mandatory. The local subnet to which the remote VPN gateway will have access. The format is an IPv4 network address, where network address <b>0.0.0.0/0</b> means any local subnet.</p>
<b>remote-subnet</b>	<p>Mandatory. The remote subnet behind the remote VPN gateway, to which the OFR will have access. The format is an IPv4 network address, where network address <b>0.0.0.0/0</b> means any subnet behind the remote VPN gateway.</p>

---

---

<b>esp-group</b>	Mandatory. The named ESP configuration to be used for this connection. The ESP configuration must have already been defined, using the the <b>vpn ipsec esp-group</b> command (see page 361).
------------------	---

---

---

## Usage Guidelines

Use this command to define a site-to-site connection with another VPN peer.

## Chapter 18: User Authentication

This chapter lists the commands available for setting up user accounts and user authentication.

This chapter contains the following commands.

Command	Mode	Description
<code>system login</code>	Configuration	Allows you to create user accounts and set up user authentication.
<code>show users</code>	Operational	Shows which users are currently logged on.

# system login

Allows you to create user accounts and set up user authentication.

---

## Command Mode

Configuration mode.

---

## Syntax

`set system login ...`

Use **set** to create the **login** configuration node, or to change user authentication configuration.

Note that you cannot use set to change a user name or the IP address of a RADIUS server, as these are identifiers of configuration nodes. To change this information, delete the configuration node and create a new one with the correct identifier.

`delete system login ...`

Use **delete** to delete a user or a RADIUS server, or to delete the **login** configuration node altogether. Note that the **login** configuration node is a mandatory node, so deleting this node simply resets it to default values.

---

## Configuration Statement

```
system {
  login {
    user text {
      full-name: text
      authentication {
        plaintext-password: text
        encrypted-password: text
      }
    }
    radius-server ipv4 {
      port: 1-65534
      secret: text
      timeout: 1-4294967296
    }
  }
}
```

---

## Parameters

<b>user</b>	<p>Multi-node. Creates a user account, or changes user information.</p> <p>The user name must be unique within the router. The string may be up to 32 characters, which may include alphanumeric characters and hyphens.</p> <p>You can define multiple users to be authenticated using the router's internal mechanism, by creating multiple <b>user</b> configuration nodes.</p>
<b>full-name</b>	<p>The complete name of the user. This may include alphanumeric characters, space, and hyphen. Strings that include spaces must be enclosed in double quotes.</p>
<b>authentication</b>	<p>Specifies the authentication method(s) that the user can use to log on to the router. You can assign more than one authentication method to a given user.</p>
<b>plaintext-password</b>	<p>The user's password as you enter it in plain text.</p> <p>The system encrypts the plain-text password using Message Digest 5 and stores the encrypted version internally. When you display user information, you see the encrypted password, shown as the value of the encrypted-password attribute.</p>
<b>encrypted-password</b>	<p>The encrypted version of the plain-text password that was specified for this user.</p> <p>The password is specified in plain-text as the value of the <b>plaintext-password</b> attribute, then encrypted using Message Digest 5 and the encrypted version is stored internally. When you display user information, you see the encrypted password, shown as the value of this attribute.</p>
<b>radius-server</b>	<p>Multi-node. The IP address of a remote authentication server running the RADIUS protocol. This server can be used to authenticate multiple users.</p> <p>You can define multiple RADIUS servers, by creating multiple <b>radius-server</b> configuration nodes.</p>
<b>port</b>	<p>The port for RADIUS traffic. The default is 1812.</p>

---

<b>secret</b>	Mandatory. A password, as recorded on the RADIUS server. This may include alphanumeric characters, space, and special characters. Strings that include spaces must be enclosed in double quotes.
<b>timeout</b>	Optional. A time period in seconds after which the next RADIUS server should be queried. If no other RADIUS servers remain to be queried, the login request fails. The default is 2.

---

---

## Usage Guidelines

Use this command to configure user authentication on the router.

The Vyatta OFR supports either of the following options for user account management:

- A local user database (“login” authentication).
- RADIUS authentication server

The system creates two login user accounts by default: user **vyatta** and user **root**. The user account **vyatta** can be deleted, but the user account **root** is protected and cannot be deleted. The default password for each is **vyatta**.

By default, users are authenticated first using the local user database (“login” authentication). If this fails, the system looks for a configured RADIUS server. If found, the router queries the RADIUS server using the supplied RADIUS secret. After the query is validated, the server authenticates the user from information in its database.

You supply login user passwords and RADIUS secrets in plain text. After configuration is committed, the system encrypts them and stores the encrypted version internally. When you display user configuration, only the encrypted version of the password or secret is displayed.

The argument for each of the login class sub-statements is a regular expression as defined in POSIX 1003.2. If the regular expression contains any spaces, operators, or wildcard characters, you must enclose it in double quotes.

**NOTE** *User information can be changed through the UNIX shell (providing you have sufficient permissions). However, any changes to OFR user accounts or authentication through the UNIX shell will be overwritten the next time you commit OFR CLI configuration.*

## show users

Shows which users are currently logged on.

---

### Command Mode

Operational mode.

---

### Syntax

```
show users
```

---

### Parameters

None.

---

### Usage Guidelines

Use this command what users are currently logged on to the router.

## Chapter 19: Logging

This chapter lists the commands used for system logging.

This chapter contains the following commands.

Command	Mode	Description
<code>delete log file</code>	Operational	Deletes the specified log file, including all its archive files.
<code>show log</code>	Operational	Displays the contents of the specified log file.
<code>show log directory</code>	Operational	Displays a list of files in the logging directory.
<code>system syslog</code>	Configuration	Allows you to configure system logging on the router.

## delete log file

Deletes the specified log file, including all its archive files.

---

### Command Mode

Operational mode.

---

### Syntax

```
delete log file file-name
```

---

### Parameters

<i>file-name</i>	Deletes the specified user-defined file in the <b>/var/log</b> directory, including all its archive files.
------------------	--

---

---

### Usage Guidelines

Use this command to delete a log file.

Log files are created in the **/var/log** directory. When you issue this command, the specified file and all associated archive files are deleted from this directory.

Note that deleting the log file does not stop the system from logging events. If you use this command while the system is logging events, old log events will be deleted, but events after the delete operation will be recorded in the new file. To delete the file altogether, first disable logging to the file using the **system syslog** command (see page 383), and then delete it.

# show log

Displays the contents of the specified log file.

---

## Command Mode

Operational mode.

---

## Syntax

```
show log [file file-name]
```

---

## Parameters

<b>file</b> <i>file-name</i>	Displays the contents of the specified file in the <b>/var/log</b> directory.
------------------------------	---

---

---

## Usage Guidelines

Use this command to view the contents of a log file.

When used with no option, this command displays the contents of the main log file (**/var/log/messages**), which is the default file to which the system writes syslog messages.

When the **file** *file-name* is specified, this command displays the contents of the specified user-defined file in the **/var/log/user** directory.

# show log directory

Displays a list of files in the logging directory.

---

## Command Mode

Operational mode.

---

## Syntax

```
show log directory
```

---

## Parameters

None.

---

## Usage Guidelines

Use this command to list the user-defined log files currently stored in the **/log/var/user** directory.

This is the directory where user-defined log files are stored. Syslog messages are written either to the messages file, or to a file with a name specified during syslog configuration using the **system syslog** command (see page 383).

# system syslog

Allows you to configure system logging on the router.

---

## Command Mode

Configuration mode.

---

## Syntax

<code>set system syslog ...</code>	Use <b>set</b> to create the <b>syslog</b> configuration node, or to modify system logging configuration.  Note that you cannot use <b>set</b> to change the name of a file, a host, or a user, as these are identifiers of configuration nodes. To change this information, delete the old node and recreate it using the correct identifier.
<code>delete system syslog ...</code>	Use <b>delete</b> to delete a log destination, or to delete the <b>syslog</b> configuration node altogether.

---

## Configuration Statement

```
system {
  syslog {
    console {
      facility: text {
        level: text
      }
    }
    file: text {
      facility: text {
        level: text
      }
      archive {
        files: 1-4294967296
        size: 1-4294967296
      }
    }
    host: text {
      facility: text {
        level: text
      }
    }
    user: text {
```

```

        facility: text {
            level: text
        }
    }
}

```

## Parameters

<b>console</b>	Sends the specified log messages to the console.
<b>facility</b>	<p>Multi-node. The syslog facility for which log messages are being collected. Please see the Usage Guidelines for supported facilities.</p> <p>You can send the log messages of multiple facilities to the console by creating multiple <b>facility</b> configuration nodes within the <b>console</b> node.</p>
<b>level</b>	<p>The minimum severity of log message that will be reported. Supported values are <b>emerg</b>, <b>alert</b>, <b>crit</b>, <b>err</b>, <b>warning</b>, <b>notice</b>, <b>info</b>, and <b>debug</b>.</p> <p>By default, messages of <b>err</b> severity are logged to the console.</p> <p>Please see the Usage Guidelines for the meanings of these levels.</p>
<b>file</b>	<p>Multi-node. Writes the specified log messages to the specified file in the <b>/var/log</b> directory in the local file system. File names can include numbers, letters, and hyphens.</p> <p>You can send log messages to multiple files by creating multiple <b>file</b> configuration nodes.</p>
<b>facility</b>	<p>Multi-node. The router component for which log messages are being collected. Please see the Usage Guidelines for supported logging facilities.</p> <p>You can send the log messages of multiple facilities to the console by creating multiple <b>facility</b> configuration nodes within the <b>file</b> node.</p>
<b>level</b>	<p>The minimum severity of log message that will be reported. Supported values are <b>emerg</b>, <b>alert</b>, <b>crit</b>, <b>err</b>, <b>warning</b>, <b>notice</b>, <b>info</b>, <b>debug</b>.</p> <p>By default, messages of <b>warning</b> severity are logged to file.</p> <p>Please see the Usage Guidelines for the meanings of these levels.</p>
<b>archive</b>	Changes the settings for log file archiving for the specified file.
<b>files</b>	Sets the maximum number of archive files that will be maintained for this log file. After the maximum has been reached, logs will be rotated with the oldest file overwritten. The default is 5.

---

<b>size</b>	Sets the maximum size in bytes of archive files for this log file. After the maximum has been reached, the file will be closed and archived in compressed format. The default is 0, which means unlimited.
<b>host</b>	<p>Multi-node. Sends the specified log messages to a host. The host must be running the syslog protocol. Host names can include numbers, letters, and hyphens (“-”).</p> <p>You can send log messages to multiple hosts by creating multiple <b>host</b> configuration nodes.</p>
<b>facility</b>	<p>Multi-node. The router component for which log messages are being collected. Please see the Usage Guidelines for supported facilities.</p> <p>You can send the log messages of multiple facilities to the console by creating multiple <b>facility</b> configuration nodes within the <b>host</b> node.</p>
<b>level</b>	<p>The minimum severity of log message that will be reported. Supported values are <b>emerg</b>, <b>alert</b>, <b>crit</b>, <b>err</b>, <b>warning</b>, <b>notice</b>, <b>info</b>, <b>debug</b>.</p> <p>By default, messages of <b>err</b> severity are logged to hosts.</p> <p>Please see the Usage Guidelines for the meanings of these levels.</p>

---

---

## Usage Guidelines

Use this command to configure the router’s system syslog utility.

Using this command, you can set the destinations for log messages from different routing components (facilities) and specify what severity of message should be reported for each facility.

Log messages generated by the Vyatta OFR router will be associated with one of the following levels of severity.

**NOTE** Currently, log severities can only be changed for user-defined files. The main log file at `/var/log/messages` always uses log severity **warning**.

Table 19-1 Syslog message severities

Severity	Meaning
emerg	Emergency. A general system failure or other serious failure has occurred, such that the router is unusable.
alert	Alert. Immediate action is required to prevent the system from becoming unusable—for example, because a network link has failed, or the database has become compromised.
crit	Critical. A critical condition exists, such as resource exhaustion—for example, the system is out of memory, CPU processing thresholds are being exceeded, or a hardware failure has occurred.
err	Error. An error condition has occurred, such as a failed system call. However, the system is still functioning.
warning	Warning. An event has occurred that has the potential to cause an error, such as invalid parameters being passed to a function. This situation should be monitored.
notice	Notice. A normal but significant event has occurred, such as an unexpected event. It is not an error, but could potentially require attention.
info	Informational. Normal events of interest are being reported as they occur.
debug	Debug level. Trace-level information is being provided.

The Vyatta OFR supports standard syslog facilities. These are as follows:

Table 19-2 Syslog facilities

Facility	Description
auth	Authentication and authorization
authpriv	Non-system authorization
cron	Cron daemon
daemon	System daemons
kernel	Kernel
lpr	Line printer spooler

Table 19-2 Syslog facilities

mail	Mail subsystem
mark	Timestamp
news	USENET subsystem
security	Security subsystem
syslog	System logging
user	Application processes
uucp	UUCP subsystem
local0	Local facility 0
local1	Local facility 1
local2	Local facility 2
local3	Local facility 3
local4	Local facility 4
local5	Local facility 5
local6	Local facility 6
local7	Local facility 7
*	All facilities excluding "mark"

Messages are written either to the main log file (the default) or to a file that you specify. The main log file is created in the **/var/log** directory, to the **messages** file. User-defined log files are written to the **/var/log/user** directory.

The router uses standard UNIX log rotation to prevent the file system from filling up with log files. When log messages are written to a file, the system will write up to 500 KB of log messages into the file *logfile*, where *logfile* is either the system-defined **messages** file, or a name you have assigned to the file. When *logfile* reaches its maximum size, the system closes it and compresses it into an archive file. The archive file is named *logfile.0.gz*.

At this point, the logging utility opens a new *logfile* file and begins to write system messages to it. When the new log file is full, the first archive file is renamed *logfile.1.gz* and the new archive file is named *logfile.0.gz*. The system archives log files in this way until a maximum number of log files exists. By default, this is five (that is, up to *logfile.4.gz*), where *logfile.0.gz* always represents the most recent file. After this, the oldest log archive file is deleted as it is overwritten by the next oldest file.

To change the properties of log file archiving, configure the **system syslog archive** node:

- Use the **size** parameter to specify the maximum size of the log file.

- Use the **files** parameter to specify the maximum number of archive files to be maintained.

## Chapter 20: SNMP

This chapter lists the commands for setting up the Simple Network Management Protocol on the Vyatta OFR.

This chapter contains the following commands.

Command	Mode	Description
<code>protocols snmp</code>	Configuration	Defines SNMP community and trap information for the router.
<code>clear snmp statistics</code>	Operational	Resets all SNMP statistics on the router to zero.
<code>show snmp</code>	Operational	Displays information about SNMP configuration.
<code>show snmp statistics</code>	Operational	Displays packet-level SNMP counters and statistics.

# clear snmp statistics

Resets all SNMP statistics on the router to zero.

---

## Command Mode

Operational mode.

---

## Syntax

```
clear snmp [statistics]
```

---

## Parameters

None.

---

## Usage Guidelines

Use this command to reset all SNMP counters and statistics.

## protocols snmp

Defines SNMP community and trap information for the router.

---

### Command Mode

Configuration mode.

---

### Syntax

<code>set protocols snmp ...</code>	Use <b>set</b> to create the <b>snmp</b> configuration node, or to modify SNMP configuration.  Note that you cannot use <b>set</b> to change the identifier of a configuration node. To change this information, delete the old node and create a new one with the correct identifier.
<code>delete protocols snmp ...</code>	Use <b>delete</b> to delete SNMP configuration.

---

### Configuration Statement

```
protocols {
  snmp {
    community: text {
      client: ipv4 {}
      network: ipv4net {}
      authorization: [ro|rw]
    }
    contact: text
    description: text
    location: text
    trap-target: ipv4 {}
    mibs {
      mib-module: text {
        abs-path: text
        mib-index: int
      }
    }
  }
}
```

---

## Parameters

<b>community</b>	<p>Optional. Multi-node. Defines an SNMP community. The argument is the community string to be used to authorize SNMP managers making requests of this router. Letters, numbers, and hyphens are supported.</p> <p>You can define more than one community by creating multiple <b>community</b> configuration nodes.</p> <p>By default, no community string is defined.</p>
<b>authorization</b>	<p>Optional. Specifies the privileges this community will have. Supported values are as follows:</p> <p><b>ro</b>: This community can view router information, but not change it.</p> <p><b>rw</b>: This community has read-write privileges.</p> <p>The default authorization privilege is <b>ro</b>.</p> <p>Deleting the <b>authorization</b> statement resets the privilege level to the default (<b>ro</b>).</p>
<b>client</b>	<p>Optional. Multi-node. The SNMP clients in this community that are authorized to access the server.</p> <p>You can define more than one client by creating the <b>client</b> configuration node multiple times.</p> <p>If no client or network is defined, then any client presenting the correct community string will have read-only access to the router. If any client or network is defined then only explicitly listed clients and/or networks will have access to the router.</p>
<b>network</b>	<p>Optional. Multi-node. The network of SNMP clients in this community that are authorized to access the server.</p> <p>You can define more than one network by creating the <b>network</b> configuration node multiple times.</p> <p>If no client or network is defined, then any client presenting the correct community string will have read-only access to the router. If any client or network is defined then only explicitly listed clients and/or networks will have access to the router.</p>
<b>contact</b>	<p>Optional. Records contact information for this SNMP community. This is stored as MIB-2 system information in the <b>snmpd.conf</b> configuration file. Letters, numbers, and hyphens are supported.</p>
<b>description</b>	<p>Optional. Records a brief description for this SNMP community. This is stored as MIB-2 system information in the <b>snmpd.conf</b> configuration file. Letters, numbers, and hyphens are supported.</p>

---

---

<b>location</b>	Optional. Records the location of this SNMP community. This is stored as MIB-2 system information in the <b>snmpd.conf</b> configuration file. Letters, numbers, and hyphens are supported.
<b>trap-target</b>	Optional. Multi-node. The IP address of the destination for SNMP traps. You can specify multiple destinations for SNMP traps by creating multiple <b>trap-target</b> configuration nodes. Or, you can enter a space-separated list of IP addresses.
<b>mibs</b>	Specifies information about included MIB modules.
<b>mib-module</b>	Optional. Multi-node. Allows you to add a MIB module. The argument is the MIB module file name, without the file extension.  You can add multiple MIB modules by creating multiple <b>mib-module</b> configuration nodes.
<b>abs-path</b>	The absolute path to the MIB module.
<b>mib-index</b>	This is for internal use only. The default is “0”.

---

---

## Usage Guidelines

Use this command to specify information about which SNMP communities this router should respond to, about SNMP MIBs that should be loaded, about the router’s location and contact information, and about destinations for SNMP traps.

# show snmp

Displays information about SNMP configuration.

---

## Command Mode

Operational mode.

---

## Syntax

```
show snmp
```

---

## Parameters

None.

---

## Usage Guidelines

Use this command to see how SNMP has been configured on the router.

## show snmp statistics

Displays packet-level SNMP counters and statistics.

---

### Command Mode

Operational mode.

---

### Syntax

```
show snmp [statistics]
```

---

### Parameters

None.

---

### Usage Guidelines

Use this command to view packet-level counters and statistics for SNMP.

Table 20-1 shows the statistics that are maintained for received packets.

Table 20-1 SNMP statistics about received packets

Input—Information about received packets	
Packets	Total number of messages delivered to the SNMP entity from the transport service.
Bad versions	Total number of messages delivered to the SNMP entity that were for an unsupported SNMP version.
Bad community names	Total number of messages delivered to the SNMP entity that used an SNMP community name not known to the entity.
Bad community uses	Total number of messages delivered to the SNMP entity that represented an SNMP operation that was not allowed by the SNMP community named in the message.
ASN parse errors	Total number of ASN.1 or BER errors encountered by the SNMP entity when decoding received SNMP messages.
Too bigs	Total number of SNMP PDUs delivered to the SNMP entity with an error status field of tooBig.
No such names	Total number of SNMP PDUs delivered to the SNMP entity with an error status field of noSuchName.
Bad value	Total number of SNMP PDUs delivered to the SNMP entity with an error status field of badValue.

Table 20-1 SNMP statistics about received packets

Input—Information about received packets	
Read onlys	Total number of valid SNMP PDUs delivered to the SNMP entity with an error status field of readOnly. Only incorrect implementations of SNMP generate this error.
General errors	Total number of SNMP PDUs delivered to the SNMP entity with an error status field of genErr.
Total requests varbinds	Total number of MIB objects retrieved successfully by the SNMP entity as a result of receiving valid SNMP GetRequest and GetNext PDUs.
Total set varbinds	Total number of MIB objects modified successfully by the SNMP entity as a result of receiving valid SNMP SetRequest PDUs.
Get requests	Total number of SNMP GetRequest PDUs that have been accepted and processed by the SNMP entity.
Get nexts	Total number of SNMP GetNext PDUs that have been accepted and processed by the SNMP entity.
Set requests	Total number of SNMP SetRequest PDUs that have been accepted and processed by the SNMP entity.
Get responses	Total number of SNMP GetResponse PDUs that have been accepted and processed by the SNMP entity.
Traps	Total number of SNMP traps generated by the SNMP entity.

Table 20-2 shows the statistics that are maintained for transmitted packets.

Table 20-2 SNMP statistics about transmitted packets

Output—Information about transmitted packets	
Packets	Total number of messages passed from the SNMP entity to the transport service.
Too bigs	Total number of SNMP PDUs generated by the SNMP entity with an error status field of tooBig.
No such names	Total number of SNMP PDUs delivered to the SNMP entity with an error status field of noSuchName.
Bad values	Total number of SNMP PDUs generated by the SNMP entity with an error status field of badValue.
General errors	Total number of SNMP PDUs generated the SNMP entity with an error status field of genErr.

Table 20-2 SNMP statistics about transmitted packets

Output—Information about transmitted packets	
Get requests	Total number of SNMP GetRequest PDUs generated by the SNMP entity.
Get nexts	Total number of SNMP GetNext PDUs generated by the SNMP entity.
Set requests	Total number of SNMP SetRequest PDUs generated by the SNMP entity.
Get responses	Total number of SNMP GetResponse PDUs generated by the SNMP entity.
Traps	Total number of SNMP traps generated by the SNMP entity.

## Examples

Example 20-1 shows sample output for the **show snmp statistics** command:

Example 20-1 “show snmp statistics”: Viewing SNMP statistics

```
vyatta@vyatta> show snmp statistics
SNMP statistics:
  Input:
    Packets: 246213, Bad versions: 12, Bad community names: 12,
    Bad community uses: 0, ASN parse errors: 96,
    Too bigs: 0, No such names: 0, Bad values: 0,
    Read onlys: 0, General errors: 0,
    Total request varbinds: 227084, Total set varbinds: 67,
    Get requests: 44942, Get nexts: 190371, Set requests: 10712,
    Get responses: 0, Traps: 0,
  Output:
    Packets: 246093, Too bigs: 0, No such names: 31561,
    Bad values: 0, General errors: 2,
    Get requests: 0, Get nexts: 0, Set requests: 0,
    Get responses: 246025, Traps: 0
```

## Chapter 21: Diagnostics and Debugging

This chapter lists supported commands that can be used for diagnostics and debugging.

This chapter contains the following commands.

Command	Mode	Description
ping	Operational	Sends ICMP ECHO_REQUEST packets to IPv4 network hosts.
ping6	Operational	Sends ICMP ECHO_REQUEST packets to IPv6 network hosts.
tracert	Operational	Displays the route packets take to an IPv4 network host.
tracert6	Operational	Displays the route packets take to an IPv6 network host.

See also the following commands in other chapters.

reboot	Operational	Reboots the router. See page 38.
show system boot-messages	Operational	Displays boot messages generated by the kernel. See page 54.
show system connections	Operational	Displays active network connections on the system. See page 56.
show system kernel-messages	Operational	Displays messages in the kernel ring buffer. See page 58.
show system memory	Operational	Displays system memory usage. See page 60.
show system storage	Operational	Displays system file system usage and available storage space. See page 63.
show tech-support	Operational	Provides a consolidated report of system information. See page 64.
show version	Operational	Displays information about the version of router software. See page 66.

# ping

Sends ICMP ECHO\_REQUEST packets to IPv4 network hosts.

## Syntax

```
ping host [-c count] [-i interval] [-s packetsize] [-t tll] [-w timeout]
      [-M hint]
```

## Parameters

<i>host</i>	The host being pinged. Can be specified either as name (if DNS is being used on the network) or as an IPv4 address.
<b>-c</b> <i>count</i>	Stop after sending (and receiving) <i>count</i> ECHO_RESPONSE packets.
<b>-i</b> <i>interval</i>	The time in seconds to wait before sending the next packet.
<b>-t</b> <i>tll</i>	Sets the IP time to live value in the packets. The range is 1 to 255. The default is 64.
<b>-s</b> <i>packetsize</i>	Specifies the number of data bytes to be sent.
<b>-w</b> <i>wait</i>	Sets the in seconds to wait for a response.
<b>-M</b> <i>hint</i>	Selects the path MTU Discovery strategy. The default hint is “do set the DF flag”.

## Usage Guidelines

The `ping` command is used to test whether a network host is reachable or not.

The `ping` command uses the ICMP protocol’s mandatory ECHO\_REQUEST datagram to elicit an ICMP ECHO\_RESPONSE from a host or gateway. ECHO\_REQUEST datagrams (pings) have an IP and ICMP header, followed by a “struct timeval” and then an arbitrary number of pad bytes used to fill out the packet.

To interrupt the ping command, press <Ctrl>+c.

When using ping for fault isolation, it should first be run on the local host, to verify that the local network interface is up and running. Then, hosts and gateways further and further away should be “pinged”. Round-trip times and packet loss statistics are computed.

If duplicate packets are received, they are not included in the packet loss calculation, although the round-trip time of these packets is used in calculating the minimum/average/maximum round-trip time numbers. When the specified number of packets have been sent (and received) or if the program is terminated, a brief summary is displayed.

---

## Examples

Example 21-1 shows sample output of the `ping` command:

### Example 21-1 Sample output of “ping”

---

```
vyatta@vyatta> ping 10.3.0.2
PING 10.3.0.2 (10.3.0.2): 56 data bytes
64 bytes from 10.3.0.2: icmp seq=0 ttl=64 time=0.281 ms
64 bytes from 10.3.0.2: icmp seq=1 ttl=64 time=0.244 ms
64 bytes from 10.3.0.2: icmp seq=2 ttl=64 time=0.302 ms
64 bytes from 10.3.0.2: icmp seq=3 ttl=64 time=0.275 ms

# ping6

Sends ICMP ECHO\_REQUEST packets to IPv6 network hosts.

## Syntax

```
ping host [-c count] [-i interval] [-s packetsize] [-t tll] [-w timeout]
      [-M hint]
```

## Parameters

<i>host</i>	The host being pinged. Can be specified either as name (if DNS is being used on the network) or as an IPv6 address.
<b>-c</b> <i>count</i>	Stop after sending (and receiving) <i>count</i> ECHO_RESPONSE packets.
<b>-i</b> <i>interval</i>	The time in seconds to wait before sending the next packet.
<b>-t</b> <i>tll</i>	Sets the IP time to live value in the packets. The range is 1 to 255. The default is 64.
<b>-s</b> <i>packetsize</i>	Specifies the number of data bytes to be sent.
<b>-w</b> <i>wait</i>	Sets the in seconds to wait for a response.
<b>-M</b> <i>hint</i>	Selects the path MTU Discovery strategy. The default hint is “do set the DF flag”.

## Usage Guidelines

The `ping` command is used to test whether an IPv6 network host is reachable or not.

The `ping` command uses the ICMP protocol’s mandatory ECHO\_REQUEST datagram to elicit an ICMP ECHO\_RESPONSE from a host or gateway. ECHO\_REQUEST datagrams (pings) have an IP and ICMP header, followed by a “struct timeval” and then an arbitrary number of pad bytes used to fill out the packet.

To interrupt the ping command, press <Ctrl>+c.

When using ping for fault isolation, it should first be run on the local host, to verify that the local network interface is up and running. Then, hosts and gateways further and further away should be “pinged”. Round-trip times and packet loss statistics are computed.

If duplicate packets are received, they are not included in the packet loss calculation, although the round-trip time of these packets is used in calculating the minimum/average/maximum round-trip time numbers. When the specified number of packets have been sent (and received) or if the program is terminated, a brief summary is displayed.

---

## Examples

Example 21-1 shows sample output of the **ping6** command:

Example 21-2 Sample output of “ping6”

---

```
vyatta@vyatta> ping6 ::10.4.1.1
PING 10.3.0.2 (::10.4.1.1): 56 data bytes
64 bytes from ::10.4.1.1: icmp seq=0 ttl=64 time=0.281 ms
64 bytes from ::10.4.1.1: icmp seq=1 ttl=64 time=0.244 ms
64 bytes from ::10.4.1.1: icmp seq=2 ttl=64 time=0.302 ms
64 bytes from ::10.4.1.1: icmp seq=3 ttl=64 time=0.275 ms
Command interrupted!

```

---

# traceroute

Displays the route packets take to an IPv4 network host.

---

## Syntax

```
traceroute host
```

---

## Parameters

---

<i>host</i>	The host that is the destination for the packets. Can be specified either as name (if DNS is being used on the network) or as an IPv4 address.
-------------	--

---

---

## Usage Guidelines

Traceroute utilizes the IP protocol time to live (“ttl”) field and attempts to elicit an ICMP TIME\_EXCEEDED response from each gateway along the path to some host to track the route a set of packets follows. It attempts to trace the route an IP packet would follow to some internet host by launching UDP probe packets with a small ttl then listening for an ICMP “time exceeded” reply from a gateway.

## traceroute6

Displays the route packets take to an IPv6 network host.

---

### Syntax

```
traceroute host
```

---

### Parameters

---

<i>host</i>	The host that is the destination for the packets. Can be specified either as name (if DNS is being used on the network) or as an IPv6 address.
-------------	--

---

---

### Usage Guidelines

Traceroute utilizes the IP protocol time to live (“ttl”) field and attempts to elicit an ICMP TIME\_EXCEEDED response from each gateway along the path to some host to track the route a set of packets follows. It attempts to trace the route an IP packet would follow to some internet host by launching UDP probe packets with a small ttl then listening for an ICMP “time exceeded” reply from a gateway.

## Chapter 22: Software Upgrades

This chapter lists commands for using the Vyatta OFR's software upgrade mechanism.

This chapter contains the following commands.

Command	Mode	Description
<code>delete package</code>	Operational	Removes one or more previously installed software components from the system.
<code>install package</code>	Operational	Installs one or more specific packages onto the router.
<code>show package info</code>	Operational	Displays information about packages that are available in the software repository.
<code>show package installed</code>	Operational	Lists software packages that have already been installed.
<code>show package statistics</code>	Operational	Displays statistics about update packages residing on your system.
<code>system package</code>	Configuration	Specifies the information needed for automatic software updates.
<code>update package</code>	Operational	Upgrades installed packages.
<code>update package-list</code>	Operational	Updates the list of packages available to install.

# delete package

Removes one or more previously installed software components from the system.

---

## Command Mode

Operational mode.

---

## Syntax

```
delete package pkg-name [pkg-name ...]
```

---

## Parameters

<i>pkg-name</i>	Mandatory. The name of a package. You can specify more than one package using a space-separated list.
-----------------	---

---

## Usage Guidelines

Use this command to remove previously installed software packages from the system.

All packages matching the specified package name(s) are removed. You must supply at least one package name.

If there are packages that depend on the package being removed, the system removes all dependent packages. You cannot remove a package without removing packages that depend on it.

Package removal may take some time to complete, and the system displays a progress indicator during removal. You can cancel package removal at any time, by pressing <Ctrl>-c.

# install package

Installs one or more specific packages onto the router.

---

## Command Mode

Operational mode.

---

## Syntax

```
install package pkg-name [pkg-name ...]
```

---

## Parameters

---

<i>pkg-name</i>	At least one package name must be specified. You can specify more than one package using a space-separated list.
-----------------	--

---

---

## Usage Guidelines

Use this command to install software packages onto the router.

All packages matching the specified package name(s) are downloaded, and then installed. You must supply at least one package name. If a package matching the specified package name is already installed, the system will report an error.

The system will retrieve the most recent version of the specified package from the software archive. If this package depends on another package, the system will resolve the dependencies and install any other required packages.

Package installation may take some time to complete, and the system displays a progress indicator during installation. You can cancel installation at any time, by pressing <Ctrl>-c.

## show package info

Displays information about packages that are available in the software repository.

---

### Command Mode

Operational mode.

---

### Syntax

```
show package info pkg-name [pkg-name ...] |
```

---

### Parameters

---

<i>pkg-name</i>	Shows detailed information about all packages matching the specified package name. You can specify more than one package in a space-separated list.
-----------------	---

---

---

### Usage Guidelines

Use this command to display information about software packages available for upgrading the router software.

The router maintains a list packages that are available in all configured repositories; you can force this list to synchronize with the repository using the **update package-list** command (see page 417).

# show package installed

Lists software packages that have already been installed.

---

## Command Mode

Operational mode.

---

## Syntax

```
show package installed [pkg-name [pkg-name ...]] |
```

---

## Parameters

<i>pkg-name</i>	Show information for just the specified installed package. You can specify more than one package in a space-separated list.
-----------------	---

---

## Usage Guidelines

Use this command to display information about software packages you have already installed into the system.

# show package statistics

Displays statistics about update packages residing on your system.

---

## Command Mode

Operational mode.

---

## Syntax

```
show package statistics
```

---

## Parameters

None.

---

## Usage Guidelines

Use this command to display information about software packages residing on your system. The information displayed includes the number of packages, the number of dependencies between packages, and so on.

# system package

Specifies the information needed for automatic software updates.

---

## Command Mode

Configuration mode.

---

## Syntax

<code>set system package repository</code> <code>text ...</code>	Creates or modifies a software update repository (location).
<code>delete package repository</code> <code>text ...</code>	Deletes the specified software update repository (location).

---

## Configuration Statement

```
system {  
  package {  
    repository: text {  
      description: text  
      url: text  
      component: text  
    }  
  }  
}
```

---

## Parameters

<b>repository</b>	Multi-node. The version number of the software. For example, <code>repository 1.1</code>
	You can define more than one software repository by creating multiple <b>repository</b> nodes.
<b>description</b>	A brief description for the repository.
<b>url</b>	Mandatory. The full URL of the server hosting the software repository, including the path if required.

---

<b>component</b>	Multi-node. The repository component names.  You can configure more than one component within a repository by creating multiple <b>component</b> nodes. The stock components are <b>main</b> and <b>security</b> .
------------------	--

---

---

## Usage Guidelines

Use this command to specify the information needed to obtain software updates from the Vyatta software archive.

Vyatta OFR packages are stored in the Vyatta software repository. Access to this repository is available with a support contract.

# update package

Upgrades installed packages.

---

## Command Mode

Operational mode.

---

## Syntax

```
update package [pkg-name [pkg-name ...]
```

---

## Parameters

<i>pkg-name</i>	Upgrades only the specified package, plus any dependencies. You can specify more than one package using a space-separated list.
-----------------	---

---

## Usage Guidelines

Use this command to upgrade your system software.

When used with no option, this command upgrades all installed packages, including any necessary dependencies.

Packages are downloaded from the repository and upgraded in the correct order. Packages are upgraded to the most recent version available in the repository, provided all dependencies can be satisfied. Packages for which dependencies cannot be satisfied, or that have conflicts with installed software, are not “kept back” and not installed.

Before running this command, you should use the **show package info** command to confirm the complete list of packages that will be upgraded.

# update package-list

Updates the list of packages available to install.

---

## Command Mode

Operational mode.

---

## Syntax

```
update package-list
```

---

## Parameters

None.

---

## Usage Guidelines

Use this command to update the list of packages that are available in the repository.

The router maintains its own list of available packages; issuing this command synchronizes the router's list with the configured software repository.

Updating the package list may take some time to complete, especially if there are many packages or your connection to the repository is slow. You can cancel the update at any time, by pressing <Ctrl>-c.

## Appendix A: ICMP Types

This appendix lists the ICMP types defined by the Internet Assigned Numbers Authority (IANA).

The Internet Assigned Numbers Authority (IANA) has developed a standard that maps a set of integers and standard literal strings onto ICMP types. Table A-1 lists the ICMP types defined by the IANA.

Table A-1 ICMP types

ICMP Type	Literal
0	echo-reply
3	unreachable
4	source-quench
5	redirect
6	alternate-address
8	echo
9	router-advertisement
10	router-solicitation
11	time-exceeded
12	parameter-problem
13	timestamp-reply
14	timestamp-request
15	information-request
16	information-reply
17	mask-request
18	mask-reply
31	conversion-error
32	mobile-redirect
33	where-are-you
34	i-am-here
35	mobile-regist-request
36	mobile-regist-response
37	domainname-request

Table A-1 ICMP types

ICMP Type	Literal
38	domainname-response
39	skip
40	photuris

## Appendix B: Regular Expressions

This appendix describes the regular expressions that can be recognized by the Vyatta OFR.

The Vyatta OFR supports POSIX-style regular expressions.

POSIX expressions are an extension of standard UNIX regular expressions. A regular expression is a string representing a pattern that describes or matches a set of strings.

In these regular expressions, most characters (*literals*) match themselves and nothing else. For example, “a” matches “a”, “ab” matches “ab”, and so on. A small set of characters (*metacharacters*) carry special meaning. Table B-1 describes supported metacharacters.

Table B-1 Regular expression metacharacters

Metacharacter	Meaning
.	Matches any single character. Note that the dot does not match a newline character. For example: <ul style="list-style-type: none"> <li>.at matches “aat”, “bat”, “cat”, and so on.</li> </ul>
[ ]	Matches any single character included within the brackets. You can also specify a range of characters using the hyphen. Individual characters can be mixed with ranges. For example: <p>Examples:</p> <ul style="list-style-type: none"> <li>[abc] matches either “a”, “b”, or “c”. It does not match “ab” or “abc”.</li> <li>[a-d] matches “a”, “b”, “c”, or “d”.</li> <li>[a-dqrs] matches “a”, “b”, “c”, “d”, “q”, “r”, or “s”, and so does [a-dq-s].</li> </ul> <p>If you want to match the hyphen character itself (“-”), position it as either the very first or the very last character in the list; for example:</p> <ul style="list-style-type: none"> <li>[-abc] or [abc-] matches “-”, “a”, “b”, or “c”.</li> </ul> <p>Otherwise, it is interpreted as a range separator.</p> <p>If you want to match the square brackets themselves, place the right (closing) square bracket first in the list, followed by the left (opening) square bracket, as follows:</p> <ul style="list-style-type: none"> <li>[ ] [ab] matches “[”, “]”, “a”, or “b”.</li> </ul>
[^]	Matches any single character that is NOT included within the brackets. Individual characters can be mixed with ranges. <p>Examples:</p> <ul style="list-style-type: none"> <li>[^abc] matches any single character OTHER than “a”, “b”, or “c”.</li> <li>[^a-z] matches any single character that is not a lowercase letter.</li> <li>[^] matches all expressions matching .at except “bat”.</li> </ul>
\ ( \)	Creates a “block” or sub-expression from the enclosed characters. For example: <ul style="list-style-type: none"> <li>\(at\) matches “at” only.</li> <li>[pb]\(at\)h matches “path” and “bath”.</li> </ul>
^	To be matched, the specified character or block must occur at the beginning of a line. <ul style="list-style-type: none"> <li>^[hc]at matches “hat” and “cat”, but only at the beginning of a line.</li> </ul>

Table B-1 Regular expression metacharacters

Metacharacter	Meaning
\$	To be matched, the specified character or block must occur at the end of a line. <ul style="list-style-type: none"> <li>• [hc]at\$ matches "hat" and "cat", but only at the end of a line.</li> <li>• ^\$ matches blank lines.</li> </ul>
*	Matches 0 or more instances of the preceding single character, for example: <ul style="list-style-type: none"> <li>• [hc]* matches "", "h", and "c"</li> <li>• [hc]*at matches "", "h", "c", "at", "hat", "cat", "hcat", "chat", "hhat", "ccat", and so on.</li> </ul>
+	Matches 1 or more instances of the preceding single character or block, for example: <ul style="list-style-type: none"> <li>• [hc]+ matches "h" and "c", "hh", "hc", "cc", "ch", and so on, but not "".</li> <li>• [hc]+at matches "", "h", "c", "hat", "cat", "hcat", "chat", "hhat", "ccat", and so on, but not "at".</li> </ul>
?	Matches 0 or 1 instances of the preceding single character or block, for example: <ul style="list-style-type: none"> <li>• [hc]? matches "", "h" and "c".</li> <li>• [hc]?at matches "at", "hat", and "cat".</li> </ul>
	Alternation operator. Matches either the expression before or the expression after the operator. For example: <ul style="list-style-type: none"> <li>• abc def matches either "abc" or "def".</li> </ul>
\	The escape character. If a metacharacter is to be included as part of the search string, it must be escaped by preceding it with the backslash. This includes the backslash itself. For example: <ul style="list-style-type: none"> <li>• bat\. matches "bat.".</li> <li>• \\dev matches "\dev".</li> </ul>

To account for differences between the organization of character sets in different implementations, the POSIX standard defines a number of *classes* or categories of characters. Table B-2 lists POSIX classes.

Table B-2 POSIX classes

Class	Equivalent to:
[[:upper:]]	[A-Z] Upper case letters.
[[:lower:]]	[a-z] Lower case letters.
[[:alpha:]]	[A-Za-z] Upper and lower case letters.

Table B-2 POSIX classes

Class	Equivalent to:
[[:digit:]]	[0-9] Digits.
[[:alnum:]]	[A-Za-z0-9] Digits, and upper and lower case letters.
[[:xdigit:]]	[0-9A-Fa-f] Hexadecimal digits.
[[:punct:]]	[.,!?:....] Punctuation.
[[:blank:]]	[ \t] Space and <Tab>.
[[:space:]]	[ \t\n\r\f\v] Characters generating white space.
[[:cntrl:]]	Control characters.
[[:graph:]]	[^\t\n\r\f\v] Printed characters.
[[:print:]]	[^\t\n\r\f\v] Printed characters and blank space.

# Quick Guide to Configuration Statements

Use this section to quickly see the complete syntax of configuration statements.

The Vyatta OFR supports the following configuration statements:

- firewall
- interfaces
- multicast
- policy
- protocols
- rtrmgr
- service
- system
- vpn

## firewall

```

firewall {
    log-martians: [enable|disable]
    send-redirects: [enable|disable]
    receive-redirects: [enable|disable]
    ip-src-route: [enable|disable]
    broadcast-ping: [enable|disable]
    syn-cookies: [enable|disable]
    name: text {
        description: text
        rule: 1-1024 {
            protocol: [all|tcp|udp|icmp|igmp|ipencap|gre|esp|ah|
                ospf|pim|vrrp]
            icmp {
                type: text {
                    code: text
                }
            }
            state {
                established: [enable|disable]
                new: [enable|disable]
                related: [enable|disable]
                invalid: [enable|disable]
            }
            action: [accept|drop|reject]
            log: [enable|disable]
            source {
                address: ipv4
                network: ipv4net
                range {
                    start: ipv4
                    stop: ipv4
                }
                port-number: 1-65535
                port-name: [http|ftp|smtp|telnet|ssh|dns|snmp]
                port-range {
                    start: 1-65535
                    stop: 1-65535
                }
            }
        }
    }
    destination {
        address: ipv4
        network: ipv4net
        range {
            start: ipv4
            stop: ipv4
        }
    }
}

```

```
port-number: 1-65535
port-name: [http|ftp|smtp|telnet|ssh|dns|snmp]
port-range {
    start: 1-65535
    stop: 1-65535
}
}
}
}
```

## interfaces

```

interfaces {

# Glossary

<b>AS</b>	<i>See</i> Autonomous System.
<b>Autonomous System</b>	A routing domain that is under one administrative authority, and which implements its own routing policies. A key concept in BGP.
<b>BGP</b>	Border Gateway Protocol.
<b>Bootstrap Router</b>	A PIM-SM router that chooses the RPs for a domain from amongst a set of candidate RPs.
<b>BSR</b>	<i>See</i> Bootstrap Router.
<b>Candidate RP</b>	A PIM-SM router that is configured to be a candidate to be an RP. The Bootstrap Router will then choose the RPs from the set of candidates.
<b>Dynamic Route</b>	A route learned from another router via a routing protocol such as RIP or BGP.
<b>EGP</b>	<i>See</i> Exterior Gateway Protocol.
<b>Exterior Gateway Protocol</b>	A routing protocol used to route between Autonomous Systems. The main example is BGP.
<b>IGMP</b>	Internet Group Management Protocol. <i>TBD</i>
<b>IGP</b>	<i>See</i> Interior Gateway Protocol.
<b>Interior Gateway Protocol</b>	A routing protocol used to route within an Autonomous System. Examples include RIP, OSPF and IS-IS.
<b>MLD</b>	Multicast Listener Discovery protocol. <i>TBD</i>
<b>MRIB</b>	<i>See</i> Multicast RIB.

---

<b>Multicast RIB</b>	The part of the RIB that holds multicast routes. These are not directly used for forwarding, but instead are used by multicast routing protocols such as PIM-SM to perform RPF checks when building the multicast distribution tree.
<b>OSPF</b>	Open Shortest Path First. An IGP routing protocol based on a link-state algorithm. Used to route within medium to large networks.
<b>PIM-SM</b>	Protocol Independent Multicast, Sparse-Mode TBD
<b>Rendezvous Point</b>	A router used in PIM-SM as part of the rendezvous process by which new senders are grafted on to the multicast tree.
<b>Reverse Path Forwarding</b>	Many multicast routing protocols such as PIM-SM build a multicast distribution tree based on the best route back from each receiver to the source, hence multicast packets will be forwarded along the reverse of the path to the source.
<b>RIB</b>	<i>See</i> Routing Information Base.
<b>RIP</b>	Routing Information Protocol. <i>TBD</i>
<b>Routing Information Base</b>	The collection of routes learned from all the dynamic routing protocols running on the router. Subdivided into a Unicast RIB for unicast routes and a Multicast RIB.
<b>RP</b>	<i>See</i> Rendezvous Point.
<b>RPF</b>	<i>See</i> Reverse Path Forwarding.
<b>Static Route</b>	A route that has been manually configured on the router.
<b>xorpsh</b>	XORP command shell.
<b>xorp rtrmgr</b>	XORP router manager process.
