1. ZenPacks	1
1.1. About ZenPacks	1
1.1.1. Working with ZenPacks	1
1.2. Viewing Loaded ZenPacks	1
1.3. Installing ZenPacks	2
1.3.1. Installing from the Command Line	2
1.3.2. Installing from the User Interface	3
1.4. Creating ZenPacks	3
1.4.1. Why Create a ZenPack?	3
1.4.2. Create a ZenPack	3
1.4.3. Add a Database Object to a ZenPack	4
1.4.4. View Database Objects in a ZenPack	4
1.4.5. Remove a Database Object from a ZenPack	5
1.4.6. Adding Other Items to ZenPacks	5
1.5. Packaging and Distributing ZenPacks	5
1.6. Removing ZenPacks	6
1.7. Where to Find More Information	6
2. Advanced Search	7
2.1. About	7
2.1.1. Working with Saved Searches	8
2.2. Prerequisites	8
3. AIX	9
3.1. About	9
3.2. Prerequisites	9
3.3. Add an AIX Server	9
3.4. Set AIX Server Monitoring Credentials	10
3.5. Resolving <code>CHANNEL_OPEN_FAILURE</code> Issues	10
3.6. Resolving <code>Command timed out</code> Issues	11
3.7. Daemons	11
4. Amazon Web Services	12
4.1. About	12
4.2. Prerequisites	12
4.3. Setup	12
4.4. Working with the EC2Manager Account	14
4.4.1. CloudWatch Data	14
4.4.2. Templates and Collection	15
4.4.2.1. Example: Initiating Load-Based Elasticity for an EC2 Setup	15
5. Apache Tomcat Application Server	16
5.1. About	16
5.2. Prerequisites	16
5.3. Enable Monitoring	17
5.3.1. Configuring Tomcat to Allow JMX Queries	17
5.3.2. Configuring Resource Manager	17
5.4. Change the Amount of Data Collected and Graphed	18
5.5. Viewing Raw Data	19
5.6. Daemons	19
6. Apache Web Server	20
6.1. About	20
6.2. Prerequisites	20
6.3. Enable Monitoring	20
6.3.1. Display the Status Page in Apache Version 1.3 or Higher	20
6.3.2. Display the Status Page in Apache Version 2.x	21
6.3.3. Verifying Your Apache Configuration	23
6.3.4. Configure Resource Manager to Monitor the Web Server	23

6.4. Daemons	24
7. BEA WebLogic Application Server	25
7.1. About	25
7.1.1. Overall Application Server Vitals	25
7.1.2. Entity EJB, Message Driven Bean (MDB), and Session EJB Subsystem Metrics	25
7.1.3. Data Pool (JDBC) metrics	25
7.1.4. Queue (JMS) Metrics	26
7.2. Prerequisites	26
7.3. Enable Monitoring	26
7.3.1. Configuring WebLogic to Allow JMX Queries	26
7.3.2. Configuring Resource Manager	26
7.4. Change the Amount of Data Collected and Graphed	27
7.5. Viewing Raw Data	28
7.6. Monitor SSL-Proxied WebLogic Servers	28
7.7. Daemons	28
8. BIG-IP Network Devices	29
8.1. About	29
8.2. Prerequisites	29
8.3. Enable Monitoring	29
8.4. Viewing Virtual Servers	30
8.5. Daemons	30
9. Brocade SAN Switches	31
9.1. About	31
9.2. Prerequisites	31
9.3. Enable Monitoring	31
9.3.1. Configuring Brocade Devices to Allow SNMP Queries	31
9.3.2. Configuring Resource Manager	31
9.4. Viewing Fibre Channel Port Information	32
9.5. Daemons	32
10. CheckPoint Firewalls	33
10.1. About	33
10.2. Prerequisites	33
10.3. Enable Monitoring	33
10.3.1. Configuring CheckPoint Firewalls to Allow SNMP Queries	33
10.3.2. Configuring Resource Manager	33
10.4. Daemons	34
11. Cisco Devices	35
11.1. About	35
11.2. Prerequisites	35
11.3. Enable Monitoring	35
11.3.1. Configuring Cisco Devices to Allow SNMP Queries	35
11.3.2. Configuring Resource Manager	35
11.4. Forwarding Syslog Messages to Resource Manager	36
11.5. Extended Capabilities for Cisco Devices	36
11.5.1. IOS	36
11.5.2. CatOS	37
11.5.3. ASA, FWSM and PIX	37
11.5.4. Wireless LAN Controllers	37
11.5.5. ACE Load Balancers	37
11.5.6. Telepresence Codecs	37
11.6. Daemons	38
12. Cisco UCS	39
12.1. About	39
12.2. Prerequisites	39

12.3. Adding a Cisco UCS Device for Monitoring	39
12.4. UCS Monitoring Credentials	40
12.5. Daemons	40
13. Datacenter View	41
13.1. About	41
13.2. Prerequisites	42
13.3. Working with the List View	42
13.4. Working with the Custom View	42
13.4.1. Adding a Background Image to the Custom View	42
13.4.1.1. Removing the Custom View Background Image	43
13.4.2. Working with Devices in the Custom View	43
13.4.3. Removing the Custom View	43
13.5. Activating the Auto-Generated Rack View	44
14. Dell Hardware	45
14.1. About	45
14.2. Prerequisites	45
14.3. Enable Enhanced Modeling	45
14.4. Daemons	46
15. Device Access Control Lists	47
15.1. About	47
15.2. Prerequisites	47
15.3. Key Concepts	47
15.3.1. Permissions and Roles	47
15.3.2. Administered Objects	47
15.3.3. Users and Groups	47
15.3.4. Assigning Administered Object Accessa	48
15.3.5. Restricted Screen Functionality	48
15.3.5.1. Dashboard	48
15.3.5.2. Device List	48
15.3.5.3. Device Organizers	48
15.3.5.4. Reporting	48
15.3.5.5. Viewing Events	48
15.4. Create a User Restricted to Specific Devices	48
15.5. Create a Manager Restricted to Specific Devices	49
15.6. Adding Device Organizers	49
15.7. Restricted User Organizer Management	49
16. Distributed Collector	50
16.1. About Distributed Collector	50
16.1.1. About Collectors	50
16.1.2. About Hubs	50
16.1.3. Typical Usage Scenarios for Distributed Monitoring	50
16.1.4. Prerequisites	51
16.1.5. Navigating Collectors and Hubs	51
16.2. Deploying Collectors	52
16.2.1. Installing Prerequisite Packages	52
16.2.2. Deploying Remote Collectors	53
16.2.2.1. Requirements	53
16.2.2.2. Limitations	53
16.2.2.3. Deployment	53
16.2.3. Deploying Local Collectors	57
16.3. Updating Collectors	58
16.4. Backing Up Remote Collector Performance Data	58
16.5. Deleting Collectors	58
16.6. Adding Devices to Collectors	58

16.6.1. Moving Devices Between Collectors	58
16.7. Managing the Collector Daemons	59
16.8. Deploying Hubs	59
16.8.1. Installing Prerequisites	59
16.8.2. Deploying Remote Hubs	59
16.8.2.1. Requirements	59
16.8.2.2. Limitations	60
16.8.2.3. Configuring MySQL for Remote Hubs	60
16.8.2.4. Deployment	61
16.8.3. Setting Up SSH Keys for Distributed Collector	64
17. Domain Name System (DNS)	65
17.1. About	65
17.2. DigMonitor	65
17.2.1. Prerequisites	65
17.2.2. Enable Monitoring	65
17.3. DNSMonitor	65
17.3.1. Prerequisites	66
17.3.2. Enable Monitoring	66
17.4. Daemons	66
18. Dynamic Service View	67
18.1. About	67
18.1.1. Dynamic View of Organizers	68
18.1.2. Dynamic View of Devices	69
18.1.2.1. Dynamic View of Cisco UCS Devices	69
18.1.2.2. Dynamic View of VMware Hosts	69
18.1.2.3. Dynamic View of Storage Devices	69
18.2. Prerequisites	69
18.3. Enabling	69
18.4. Daemons	70
19. Enterprise Collector	71
19.1. About	71
19.2. Prerequisites	71
19.3. Enabling Enterprise Collector	71
20. Enterprise Linux	72
20.1. About	72
20.2. Prerequisites	72
20.3. Add a Linux Server	72
20.4. Set Linux Server Monitoring Credentials	72
20.5. Resolving CHANNEL_OPEN_FAILURE Issues	73
20.6. Resolving Command timed out Issues	74
20.7. DMIDECODE Modeler Plugin	74
20.8. Daemons	75
21. Enterprise Reports	76
21.1. About	76
21.1.1. 95th Percentile	76
21.1.2. Alert Rule Email Addresses	76
21.1.3. Defined Thresholds	76
21.1.4. Event Time to Resolution	77
21.1.5. Interface Volume	77
21.1.6. Maintenance Windows	77
21.1.7. Organizer Availability	77
21.1.8. User Event Activity	77
21.1.9. Users Group Membership	77
21.2. Viewing Enterprise Reports	77

21.3. Prerequisites	78
22. Enterprise Security	79
22.1. About	79
22.2. Prerequisites	79
22.3. Enabling Password Encryption	79
23. File Transfer Protocol (FTP)	80
23.1. About	80
23.2. Prerequisites	80
23.3. Enable Monitoring	80
23.4. Enable Secure Site Monitoring	80
23.5. Tuning for Site Responsiveness	81
23.6. Daemons	81
24. Foundry Device	82
24.1. About	82
24.2. Prerequisites	82
24.3. Configuring Resource Manager	82
24.4. Daemons	83
25. HP PC Hardware	84
25.1. About	84
25.2. Prerequisites	84
25.3. Enable Enhanced Modeling	84
25.4. Daemons	85
26. Hewlett Packard UNIX	86
26.1. About	86
26.2. Prerequisites	86
26.3. Limitations	86
26.4. Add an HP-UX Device for Monitoring	86
26.5. Set HP-UX Server Monitoring Credentials	87
26.5.1. Set Credentials for the Device	87
26.5.2. Set Credentials for the Device Class	87
26.6. Resolving CHANNEL_OPEN_FAILURE Issues	87
26.7. Resolving Command time out Issues	88
26.8. Daemons	89
27. Internet Relay Chat (IRC)	90
27.1. About	90
27.2. Prerequisites	90
27.3. Enable Monitoring	90
27.4. Daemons	90
28. Jabber Instant Messaging	91
28.1. About	91
28.2. Prerequisites	91
28.3. Enable Monitoring	91
28.4. Daemons	92
29. Java 2 Platform Standard Edition (J2E)	93
29.1. About	93
29.1.1. JMX Background	93
29.1.2. ZenJMX Capabilities	93
29.1.3. Allowable Parameter Types	94
29.1.4. Single Value Attribute Calls	94
29.1.5. Complex-Value Attribute Calls	95
29.1.6. Example Method Calls	95
29.1.6.1. No parameters, single return value	95
29.1.6.2. No parameters, multiple values returned in List format	96
29.1.6.3. No parameters, multiple values returned in Map format	96

29.1.6.4. Single parameter in polymorphic operation	96
29.1.6.5. Multiple parameters in polymorphic operations	97
29.2. Prerequisites	98
29.2.1. Sun Java Runtime Environment (JRE)	98
29.3. Example to Monitor a JMX Value	98
29.3.1. Enabling Remote JMX Access	98
29.3.2. Configure Resource Manager with a Custom Data Source	99
29.4. Monitor Values in TabularData and CompositeData Objects	100
29.5. Using JConsole to Query a JMX Agent	100
29.6. Daemons	104
30. JBoss Application Server	105
30.1. About	105
30.2. Prerequisites	106
30.3. Enable Monitoring	106
30.3.1. Configuring JBoss to Allow JMX Queries	106
30.3.2. Configuring Resource Manager	106
30.4. Change the Amount of Data Collected and Graphed	107
30.5. Viewing Raw Data	108
30.6. Daemons	108
31. Juniper Devices	109
31.1. About	109
31.2. Prerequisites	109
31.3. Enable Monitoring	109
31.3.1. Configuring Juniper Devices to Allow SNMP Queries	109
31.3.2. Configuring Resource Manager	109
31.4. Daemons	110
32. LDAP Authentication	111
32.1. About	111
32.2. Prerequisites	111
32.2.1. LDAP Configuration Information	111
32.3. Limitations	112
32.4. Authenticating with Microsoft Active Directory	112
32.4.1. Adding the Authentication Plugin	112
32.4.2. Configuring Plugin Settings	112
32.4.3. Enabling Group to Role Mapping	113
32.4.4. Verifying Connectivity and Credentials Outside of Resource Manager	114
32.5. Authenticating with other LDAP Servers	114
32.6. Optimizing Authentication with a Cache	115
32.7. Configuring Local Authentication as a Fallback	116
33. Lightweight Directory Access Protocol (LDAP) Response Time	118
33.1. About	118
33.2. Prerequisites	118
33.3. Enable Monitoring	118
33.3.1. For a Device	118
33.4. Daemons	119
34. Mail Transactions	120
34.1. About	120
34.1.1. Events	120
34.2. Prerequisites	120
34.3. Enable Monitoring	120
34.4. Daemons	121
35. MS Active Directory	122
35.1. About	122
35.2. Prerequisites	122

35.3. Enable Monitoring	122
35.4. Daemons	123
36. MS Exchange	124
36.1. About	124
36.2. Prerequisites	124
36.3. Enable Monitoring	124
36.4. Daemons	125
37. Microsoft Message Queuing (MSMQ) Monitoring	126
37.1. About	126
37.2. Prerequisites	126
37.3. Configuration	126
37.3.1. Automatically Monitor Queues on All Servers	126
37.3.2. Monitor Queues on Specific Servers	127
37.3.3. Fine-Tuning Queue Monitoring	127
37.4. Daemons	127
38. Microsoft Internet Information Services (IIS)	128
38.1. About	128
38.2. Prerequisites	128
38.3. Enable Monitoring	128
38.4. Daemons	129
39. Microsoft SQL Server	130
39.1. About	130
39.2. Prerequisites	130
39.3. Enable Monitoring	130
39.4. Collecting Information from Non-Default Microsoft SQL Server Instances	131
39.5. Daemons	131
40. Multi-Realm IP Networks	132
40.1. About	132
40.2. Prerequisites	132
40.3. Example System	132
40.4. System Setup	133
40.4.1. Adding Realms	133
40.4.2. Adding Collectors to Realms	133
40.4.3. Adding Devices to Realms	134
40.5. Notes	134
41. MySQL Database	135
41.1. About	135
41.2. Prerequisites	135
41.3. Enable Monitoring	135
41.3.1. Authorize MySQL Performance Data Access	135
41.3.2. Set up Resource Manager	135
41.4. Daemons	136
42. NetApp Filers	137
42.1. About	137
42.1.1. Performance Graphs	137
42.2. Prerequisites	138
42.3. Enable Monitoring	138
42.3.1. Configuring NetApp Devices to Allow SNMP Queries	138
42.3.2. Configuring Resource Manager	138
42.4. Using SSH to Model NFS Clients	139
42.5. Forwarding syslog Events from NetApp	139
42.6. Daemons	139
43. NetScreen Devices	140
43.1. About	140

43.2. Prerequisites	140
43.3. Enable Monitoring	140
43.3.1. Configuring NetScreen Devices to Allow SNMP Queries	140
43.3.2. Configuring Resource Manager	140
43.4. Daemons	141
44. Network News Transport Protocol (NNTP)	142
44.1. About	142
44.2. Prerequisites	142
44.3. Enable Monitoring	142
44.4. Daemons	142
45. Network Time Protocol (NTP)	143
45.1. About	143
45.2. Prerequisites	143
45.3. Enable Monitoring	143
45.4. Daemons	143
46. Nexus7k	144
46.1. About	144
46.2. Prerequisites	144
46.3. Adding a Cisco Nexus 7000 Device for Monitoring	144
46.4. Monitoring Credentials	145
46.5. Daemons	145
47. Nortel Devices	146
47.1. About	146
47.2. Prerequisites	146
47.3. Enable Monitoring	146
47.3.1. Configuring Nortel Devices to Allow SNMP Queries	146
47.3.2. Configuring Resource Manager	146
47.4. Daemons	147
48. ONC-Style Remote Procedure Call (RPC)	148
48.1. About	148
48.2. Prerequisites	148
48.3. Enable Monitoring	148
48.4. Daemons	148
49. Oracle	149
49.1. About	149
49.2. Prerequisites	149
49.3. Enable Monitoring	149
49.3.1. Authorize Oracle Performance Data Access	149
49.3.2. Configure Resource Manager	149
49.4. Monitor Additional SIDs	150
49.5. Monitoring Other Tables or Views	150
49.6. Daemons	151
50. Predictive Thresholding	152
50.1. About	152
50.2. Prerequisites	152
50.3. Add a Predictive Threshold	152
51. RANCID Integration	154
51.1. About	154
51.2. Prerequisites	154
51.3. Enable Integration	154
51.3.1. Configure Cisco Devices to Send Traps	154
51.3.2. Configure RANCID Update Information in Resource Manager	154
52. Solaris	156
52.1. About	156

52.2. Prerequisites	156
52.3. Limitations	156
52.4. Set Solaris Server Monitoring Credentials	156
52.5. Enable Monitoring	157
52.6. Resolving CHANNEL_OPEN_FAILURE Issues	157
52.7. Resolving Command time out Issues	158
52.8. Daemons	158
53. Splunk Monitoring	160
53.1. About	160
53.2. Prerequisites	160
53.3. Splunk Data Source Type	160
53.4. Monitoring Splunk Searches	161
53.4.1. Monitoring Results of a Simple Search	161
53.4.2. Monitoring Results of a Top Search	163
53.5. Daemons	165
54. SSH Monitoring Example	166
54.1. About	166
54.2. Prerequisites	166
54.3. Set Linux Server Monitoring Credentials	166
54.4. Add a Linux Server	166
54.5. Daemons	167
55. SQL Transactions	168
55.1. About	168
55.2. Prerequisites	168
55.3. Enable SQL Server Monitoring	168
55.4. Enable Sybase Server Monitoring	169
55.5. Enable MySQL Server Monitoring	170
55.6. Storing Query Results	171
55.7. Troubleshooting	172
55.8. Daemons	172
56. Storage Base	173
56.1. About	173
56.2. Prerequisites	173
57. Sugar CRM	174
57.1. About	174
57.2. Prerequisites	174
57.3. Enable Monitoring	174
57.3.1. Configuring Resource Manager	174
57.4. Daemons	175
58. vCloud Monitoring	176
58.1. About	176
58.2. Adding a Cell	176
58.3. Prerequisites	177
58.4. Monitoring	178
58.5. Performance	178
59. VMware	179
59.1. vSphere	179
59.1.1. About	179
59.1.1.1. VMware Events	179
59.1.2. Prerequisites	181
59.1.3. Enable Monitoring	181
59.1.4. Viewing VMware Devices	182
59.1.5. Viewing Guest Virtual Machines	183
59.1.6. Enabling Data Collection Using resxtp	184

59.1.6.1. Gathering VMware Host Statistics	184
59.1.6.2. Gathering VMware Guest Statistics	184
59.1.7. Adding a Custom Metric	185
59.1.8. Moving VMware Devices Between Collectors	186
59.1.9. Daemons	186
59.1.9.1. Tuning Options	187
59.2. VMware ESX via SNMP	187
59.2.1. About	187
59.2.2. Prerequisites	187
59.2.3. Monitoring VMware ESX Servers	187
59.2.4. Enabling SNMP Subagents	188
59.2.5. Daemons	189
59.3. VMware esxtop	189
59.3.1. About	189
59.3.2. Prerequisites	189
59.3.2.1. Installing Prerequisite Libraries	189
59.3.3. Enabling the ZenPack	190
59.3.4. Daemons	191
60. Web Page Response Time (HTTP)	192
60.1. About	192
60.2. Prerequisites	192
60.3. Enable Monitoring	192
60.4. Check for a Specific URL or Specify Security Settings	192
60.5. Check for Specific Content on the Web Page	193
60.6. Tuning for Site Responsiveness	193
60.7. Daemons	194
61. WebSphere Application Server	195
61.1. About	195
61.2. Prerequisites	195

Chapter 1. ZenPacks

1.1. About ZenPacks

ZenPacks extend and modify the system to add new functionality. This can be as simple as adding new device classes or monitoring templates, or as complex as extending the data model and providing new collection daemons.

You can use ZenPacks to add:

- Monitoring templates
- Data sources
- Graphs
- Event classes
- Event and user commands
- Reports
- Model extensions
- Product definitions

Simple ZenPacks can be created completely within the user interface. More complex ZenPacks require development of scripts or daemons, using Python or another programming language.

ZenPacks can be distributed for installation on other Resource Manager systems.

1.1.1. Working with ZenPacks

A range of provided ZenPacks add and extend system functionality. The following sections provide information and procedures to help you:

- Install ZenPacks
- Create ZenPacks
- Package and distribute ZenPacks
- Remove ZenPacks

1.2. Viewing Loaded ZenPacks

To see which ZenPacks are loaded on your system:

1. From the navigation bar, select Advanced.

The Settings page appears.

2. Select ZenPacks in the left panel.

The list of loaded ZenPacks appears.

The screenshot shows the 'Loaded ZenPacks' section of the Zenoss interface. On the left is a navigation menu with 'ZenPacks' selected. The main area displays a table of installed ZenPacks. An action menu is open over the first three rows, showing options: 'Create a ZenPack...', 'Install ZenPack...', and 'Delete ZenPack...'.

Pack	Package	Author	Version	Egg
<input type="checkbox"/> ZenPacks.zenoss.	zenoss	Zenoss	2.0.1	Yes
<input type="checkbox"/> ZenPacks.zenoss.	zenoss	Zenoss	1.0.0	Yes
<input type="checkbox"/> ZenPacks.zenoss.	zenoss	Zenoss	1.1.3	Yes
<input type="checkbox"/> ZenPacks.zenoss.ApacheMonitor	zenoss	Zenoss	2.1.2	Yes
<input type="checkbox"/> ZenPacks.zenoss.BigIpMonitor	zenoss	Zenoss	2.2.2	Yes
<input type="checkbox"/> ZenPacks.zenoss.BrocadeMonitor	zenoss	Zenoss	2.0.4	Yes
<input type="checkbox"/> ZenPacks.zenoss.CheckPointMonitor	zenoss	Zenoss	1.0.4	Yes
<input type="checkbox"/> ZenPacks.zenoss.CiscoMonitor	zenoss	Zenoss	2.6.0	Yes
<input type="checkbox"/> ZenPacks.zenoss.DellMonitor	zenoss	Zenoss	2.1.0	Yes
<input type="checkbox"/> ZenPacks.zenoss.Diagram	zenoss	Zenoss	1.1.1	Yes
<input type="checkbox"/> ZenPacks.zenoss.DigMonitor	zenoss	Zenoss	1.0.2	Yes
<input type="checkbox"/> ZenPacks.zenoss.DistributedCollector	zenoss	Zenoss	2.2.2	Yes
<input type="checkbox"/> ZenPacks.zenoss.DnsMonitor	zenoss	Zenoss	2.0.2	Yes
<input type="checkbox"/> ZenPacks.zenoss.EnterpriseCollector	zenoss	Zenoss	1.0.0	Yes
<input type="checkbox"/> ZenPacks.zenoss.EnterpriseLinux	zenoss	Zenoss	1.1.0	Yes
<input type="checkbox"/> ZenPacks.zenoss.EnterpriseReports	zenoss	Zenoss	2.1.2	Yes
<input type="checkbox"/> ZenPacks.zenoss.EnterpriseSecurity	zenoss	Zenoss	1.0.0	Yes
<input type="checkbox"/> ZenPacks.zenoss.EnterpriseSkin	zenoss	Zenoss	2.0.1	Yes
<input type="checkbox"/> ZenPacks.zenoss.FtpMonitor	zenoss	Zenoss	1.0.2	Yes

Figure 1.1. Loaded ZenPacks

From the action menu on this page, you can create, install, and delete ZenPacks.

Note

Alternatively, you can view loaded ZenPacks from the command line:

```
zenpack --list
```

1.3. Installing ZenPacks

ZenPacks are distributed as `.egg` files. You can install ZenPacks from the command line on the Resource Manager server, or from the user interface.

1.3.1. Installing from the Command Line

Use these commands to install a ZenPack file and then restart the system:

```
zenpack --install <filename>
zenoss restart
```

If you have the source code for the ZenPack you can install directly from that rather than from an `.egg` file. The command is the same; however, you must specify the directory containing the source code. This copies the source code to `$ZENHOME/ZenPacks`:

```
zenpack --install <directoryname>
zenoss restart
```

If you are developing a ZenPack, you should maintain your source code outside of `$ZENHOME/ZenPacks` for two reasons:

- if you issue a **zenpack --remove** command it will delete your code from that location and you will lose your files unless you have them backed up elsewhere.
- if you are maintaining your source code in a version control system it is frequently more convenient to have the files reside elsewhere on the file system.

Using the **--link** option, you can install the ZenPack but have the system use your code from its current location. Instead of installing your code in `$ZENHOME/ZenPacks`, the system will create a link in that location that points to your source code directory.

```
zenpack --link --install <directoryname>  
zenoss restart
```

1.3.2. Installing from the User Interface

To upload and install a ZenPack `.egg` file from the user interface:

1. From the navigation bar, select Advanced > Settings.
2. In the left panel, select ZenPacks.
3. From  (Action menu), select Install ZenPack.

The Install ZenPack dialog appears.

4. Browse to and select the `.egg` file you want to install, and then click **OK**.

The file is uploaded to the Resource Manager server and installed.

Note

After installing the ZenPack, you should restart the system.

1.4. Creating ZenPacks

Read the following information and procedures to learn more about why you might want to create a ZenPack, and how to:

- Create a ZenPack
- Add a database object to a ZenPack
- View database objects in a ZenPack
- Remove a database object from a ZenPack
- Add other items to a ZenPack

1.4.1. Why Create a ZenPack?

Suppose you have developed a monitoring template for a new piece of hardware. You have created data sources for the OID's you think are worth monitoring, thresholds to make sure some of these values stay within reasonable limits, and several graph definitions to show this data graphically. Perhaps you also have created a new device class for this hardware. You can create a ZenPack to easily distribute your template and device class to other administrators. This ZenPack can be entirely created from within the user interface.

As another example, suppose you want to monitor a new piece of software running on one of your servers. You would like to monitor several performance metrics of this software, but they are available only via a programmatic API provided with the software. You could develop a new collector daemon to gather data via this API and provide it back to the system. You might also create a new type of data source to provide configuration data for the new collector. Obviously this effort would require development skills and intimate knowledge of the system not necessary for the previous example, but this functionality can be distributed as a ZenPack.

1.4.2. Create a ZenPack

Use the following instructions and guidelines to create a ZenPack.

Note

You must be logged in as an administrator to create a ZenPack.

1. From the navigation bar, select Advanced > Settings.
2. In the left panel, select ZenPacks.
3. From  (Action menu), select Create a ZenPack.

The Create a ZenPack dialog appears.

4. Enter the name of the ZenPack, which must be in the format:

ZenPacks.Organization.Identifier

where *Organization* is a name that identifies you or your organization and *Identifier* is a string that represents the intent of your ZenPack.

Note

Do not use underscores in ZenPack names. ZenPacks whose names include an underscore break on export.

5. Click **OK**.

The system creates the ZenPack object in the database and a new directory in the file system `$ZENHOME/ZenPacks/YourZenPackID`.

1.4.3. Add a Database Object to a ZenPack

To add a database object (such as a device, service, or event class, event mapping, user or event command, device organizer, or monitoring template) to a ZenPack:

1. Navigate to the object in the interface.
2. From the Action menu, select Add to ZenPack.

Figure 1.2. Add to ZenPack

The Add to ZenPack dialog appears.

3. Select a ZenPack from the list of installed ZenPacks, and then click **Submit**.

1.4.4. View Database Objects in a ZenPack

To view the objects that are part of a ZenPack:

1. From the navigation bar, select Advanced > Settings.
2. In the left panel, select ZenPacks.
3. Click the name of a ZenPack in the list.

The ZenPack Provides area of the page lists objects that are part of the ZenPack.

1.4.5. Remove a Database Object from a ZenPack

To remove a database object from a ZenPack:

1. From the navigation bar, select Advanced > Settings.
2. In the left panel, select ZenPacks.
3. Click the name of a ZenPack in the list.
4. Select an object in the ZenPack Provides area of the page.
5. From the Action menu, select Delete from ZenPack.

1.4.6. Adding Other Items to ZenPacks

ZenPacks can contain items that are not database items, such as:

- Daemons
- Data source types
- Skins

You can add these to a ZenPack by placing them in the appropriate subdirectory in the ZenPack's directory.

1.5. Packaging and Distributing ZenPacks

Follow these steps to create an installable ZenPack .egg file:

1. From the navigation bar, select Advanced > Settings.
2. In the left panel, select ZenPacks.
3. Click the name of a ZenPack in the list.
4. From  (Action menu) located at the bottom left of the page, select Export ZenPack.

The Export ZenPack dialog appears.

Figure 1.3. Export ZenPack

5. Select one of the export options:
 - **Export to \$ZENHOME/exports** - Exports the ZenPack to a file named *ZenPackID*.egg in the \$ZENHOME/ex-ports directory on the Resource Manager server.
 - **Export to \$ZENHOME/exports and download** - Additionally downloads the exported file to your browser. Other administrators can then install this exported .egg file.
6. Click **OK**.

1.6. Removing ZenPacks

Warning

Removing a ZenPack can have unexpected consequences. For example, removing a ZenPack that installs a device class removes the device class and all devices in that class.

Before removing a ZenPack, you should:

- Delete any data source of a type provided by the ZenPack
- Perform a backup of your system data. (See the section titled "Backup and Restore" in *Resource Manager Administration* for information on backing up your system data.)

1.7. Where to Find More Information

Further information about ZenPack development is available in the *Zenoss Service Dynamics Resource Management Developer's Guide*.

Discussions about ZenPack development and implementation take place on the zenoss-dev and zenoss-zenpacks forums:

- <http://community.zenoss.org/community/forums>
- http://community.zenoss.org/community/developers/zenpack_development
- <http://zenpacks.zenoss.org>

Chapter 2. Advanced Search

2.1. About

The AdvancedSearch ZenPack enables the advanced search facility in the user interface. This tool allows you to locate devices and other system objects, as well as events and services.

When enabled, advanced search appears adjacent to the user information area.

Figure 2.1. Advanced Search (User Information Area)

To search, enter part or all of a name in the search box. The system displays matches, categorized by type.

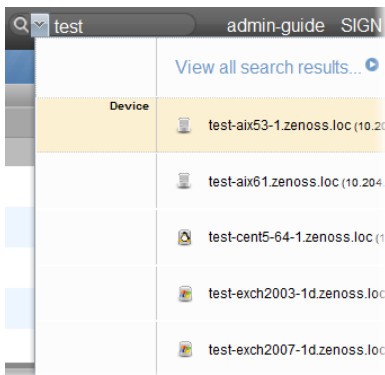

Figure 2.2. Search Results

To view all search results, click the indicator at the top of the list. The full list of results appears.

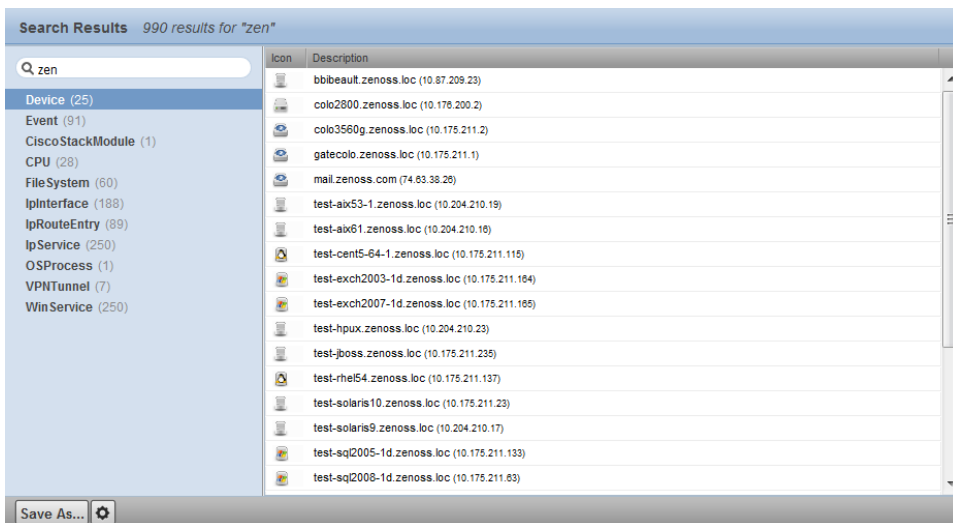

Figure 2.3. All Search Results

From here, you can display search results by category. Click in the left panel to filter search results by a selection.

2.1.1. Working with Saved Searches

To save a search:

1. Click **Save As**.

the Save Search As dialog appears.

2. Enter a name for the saved search, and then click **Submit**.

To retrieve a saved search, select it from the search box menu.

You also can manage saved searches. Access all saved searches from two locations:

- Search box menu
- Action menu located at the bottom of the Search Results page

The Manage Saved Searches dialog lets you view the queries associated with saved searches and delete saved searches.

2.2. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss Version 3.0 or higher
Required ZenPacks	ZenPacks.zenoss.AdvancedSearch

Table 2.1. Prerequisites

Chapter 3. AIX

3.1. About

The AixMonitor ZenPack enables Resource Manager to use Secure Shell (SSH) to monitor AIX hosts. Resource Manager models and monitors devices placed in the `/Server/SSH/AIX` device class by running commands and parsing the output. Parsing of command output is performed on the Resource Manager server or on a distributed collector. The account used to monitor the device does not require root access or special privileges.

Specifically, the AixMonitor ZenPack provides:

- File system and process monitoring
- Network interfaces and route modeling
- CPU utilization information
- Hardware information (memory, number of CPUs, machine serial numbers, model numbers)
- OS information (OS level command style information)
- LPP and RPM information (such as installed software)

3.2. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss Version 2.4 or higher
Required ZenPacks	ZenPacks.zenoss.AixMonitor
AIX Releases Supported	5.3 and 6.1

Table 3.1. AIX Prerequisites

Note

If using a distributed collector setup, SSH requires firewall access (default of port 22) from the collector to the monitored server.

3.3. Add an AIX Server

The following procedure assumes that the credentials have been set.

1. From Infrastructure > Devices, select Add a Single Device.
2. Enter the following information in the dialog:

Name	Description
Name or IP	AIX host to model
Device Class	<code>/Server/SSH/AIX</code>
Model Device	Select this option unless adding a device with username/password different than found in the device class. If you do not select this option, then you must add the credentials (see Section 3.4, "Set AIX Server Monitoring Credentials") and then manually model the device.

Table 3.2. Adding AIX Device Information

3. Click **Add Device** to add the device.

3.4. Set AIX Server Monitoring Credentials

All AIX servers must have a device entry in an organizer below the `/Devices/Server/SSH/AIX` device class.

Note

The SSH monitoring feature will attempt to use key-based authentication before using a configuration properties password value.

1. Navigate to the device class or device.
 - If applying changes to a device class:
 - a. Select the class in the devices hierarchy.
 - b. Click **Details**.
 - c. Select Configuration Properties.
 - If applying changes to a device:
 - a. Click the device in the device list.
 - b. Select Configuration Properties.
2. Verify the credentials for the service account to access the service.

Name	Description
zCommandUsername	AIX user with privileges to gather performance information
zCommandPassword	Password for the AIX user

Table 3.3. AIX Configuration Properties

3. Click Save to save your changes.

3.5. Resolving CHANNEL_OPEN_FAILURE Issues

The **zencommand** daemon's log file (`$ZENHOME/collector/zencommand.log`) may show messages stating:

```
ERROR zen.SshClient CHANNEL_OPEN_FAILURE: Authentication failure
WARNING:zen.SshClient:Open of command failed (error code 1): open failed
```

If the **sshd** daemon's log file on the remote device is examined, it may report that the `MAX_SESSIONS` number of connections has been exceeded and that it is denying the connection request. At least in the OpenSSH daemons, this `MAX_SESSIONS` number is a compile-time option and cannot be reset in a configuration file.

To work around this limitation of the **sshd** daemon, use the configuration property `zSshConcurrentSessions` to control the number of connections created by **zencommand** to the remote device.

1. Navigate to the device or device class in the Resource Manager interface.
 - If applying changes to a device class:
 - a. Select the class in the devices hierarchy.
 - b. Click **Details**.
 - c. Select Configuration Properties.
 - If applying changes to a device:

- a. Click the device in the device list.
 - b. Select Configuration Properties.
2. Apply an appropriate value for the maximum number of sessions.

Name	Description
zSshConcurrentSessions	Maximum number of sessions supported by the remote device's MAX_SESSIONS parameter. Common values for AIX is 2 or 10.

Table 3.4. Concurrent SSH Configuration Properties

3. Click **Save** to save your changes.

3.6. Resolving `Command timed out` Issues

The **zencommand** daemon's log file (`$ZENHOME/collector/zencommand.log`) may show messages stating:

```
WARNING:zen.zencommand:Command timed out on device device_name: command
```

If this occurs, it usually indicates that the remote device has taken too long in order to return results from the commands. In order to increase the amount of time to allow devices to return results, change the configuration property `zCommandCommandTimeout` to a larger value.

1. Navigate to the device or device class in the Resource Manager interface.
 - If applying changes to a device class:
 - a. Select the class in the devices hierarchy.
 - b. Click **Details**.
 - c. Select Configuration Properties.
 - If applying changes to a device:
 - a. Click the device in the device list.
 - b. Select Configuration Properties.
2. Apply an appropriate value for the command timeout.

Name	Description
zCommandCommandTimeout	Time in seconds to wait for commands to complete on the remote device.

Table 3.5. SSH Timeout Configuration Properties

3. Click **Save** to save your changes.

3.7. Daemons

Type	Name
Modeler	zenmodeler
Performance Collector	zencommand

Table 3.6. Daemons

Chapter 4. Amazon Web Services

4.1. About

The Amazon Web Services™ (AWS™) ZenPack allows you to monitor Amazon Elastic Compute Cloud™ (Amazon EC2™) server instances. It collects information for these objects monitored through Amazon's CloudWatch APIs:

- Account
- Instance
- Instance Type

When you install the ZenPack, the `/AWS/EC2` device class is added to your Resource Manager instance. A single device in the EC2 class, `EC2Manager`, represents your EC2 account. All instances and instance types are contained in the EC2 account manager.

4.2. Prerequisites

You must have a valid Amazon Web Services account with the Elastic Compute Cloud service enabled.

Modeling and performance requests to Amazon are sent via XML over http or https. You must open port 80, port 443, or both on your Resource Manager server so that requests can be sent to Amazon's infrastructure through the Internet.

The Resource Manager server time must be correct; otherwise, no performance data will be returned.

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss Version 2.5 or higher
Required ZenPacks	ZenPacks.zenoss.AWS

Table 4.1. Prerequisites

4.3. Setup

To set up the EC2 account manager in Resource Manager, follow these steps:

1. Retrieve your Amazon EC2 access credentials.
 - a. Browse to <http://aws.amazon.com>.
 - b. Select **Security Credentials** from the **Your Account** list of options.

The Access Key ID and Secret Access Key values appear on the Access Keys tab.

Access Credentials

In order to start using Amazon Web Services you must first identify yourself as the sender of a request to the given service. This is accomplished by sending a digital signature that is derived from a pair of public/private access keys or a valid security certificate.

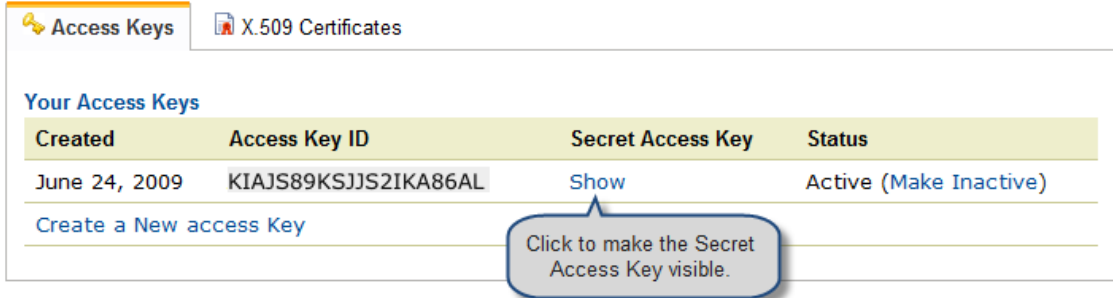

Figure 4.1. Access Credentials

- In the Resource Manager interface, select Infrastructure, and then select the EC2Manager device in the device list.
- Select Configure EC2 in the left panel.

The Configure EC2 page appears.

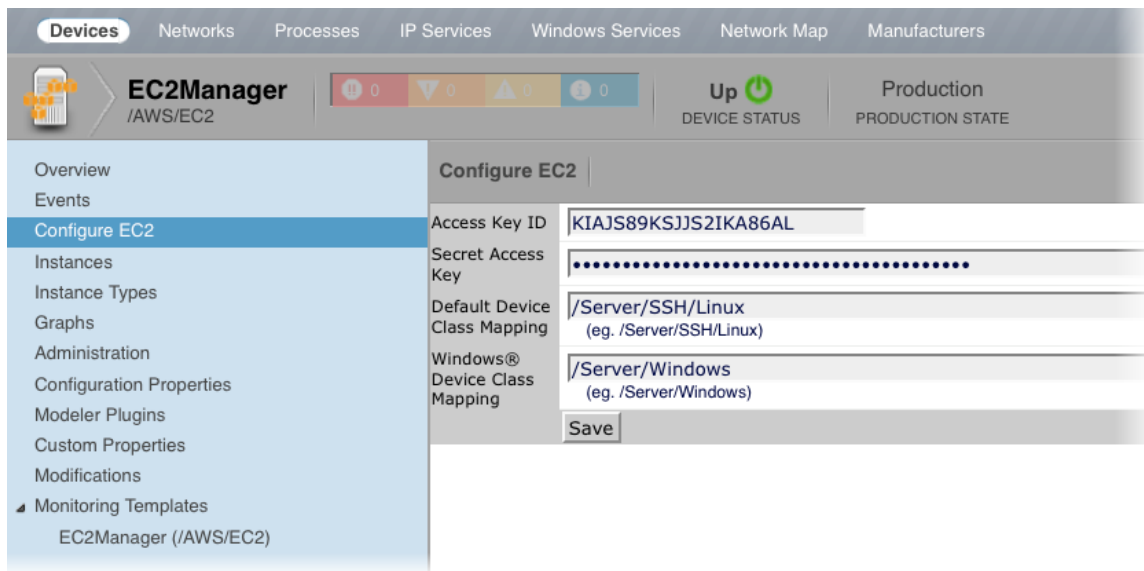

Figure 4.2. Configure EC2

- Enter access credentials.

Note

Entering a class for the Device Mapping field allows the system to monitor an EC2 instance as a normal device. If no class is specified, then the instances are monitoring within EC2Manager only.

- Model the EC2Manager account to retrieve the Instance and InstanceType objects. From the Action menu, select Model Device.

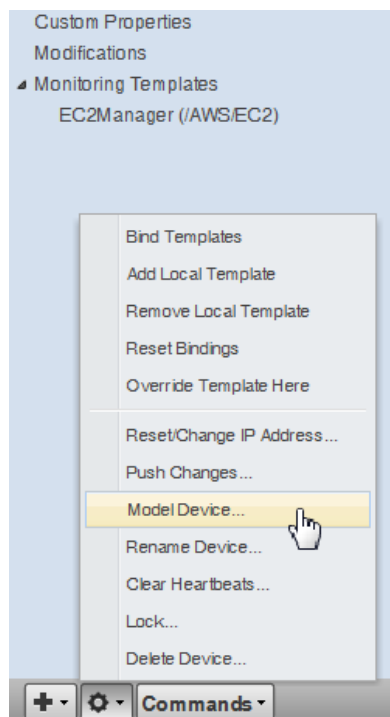

Figure 4.3. Model EC2Manager Account

4.4. Working with the EC2Manager Account

Select Infrastructure, and then select the EC2Manager account in the device list. Select Instances in the left panel to see each instance that is active in your Amazon EC2 account. Click an instance to view detailed information

The Instance Type field is a link to a type object that references all instances of a particular type.

4.4.1. CloudWatch Data

Amazon provides monitoring information through its CloudWatch APIs. These APIs provide monitoring information for each of their primary objects (Account, Instance, and Instance Type).

Metrics provided by the API are:

- CPU utilization
- Network in/out
- Disk bytes read/write
- Disk operations read/write

The metrics for an instance apply directly for the instances; for example, if an instance shows 100% CPU utilization, then its CPU is at maximum. However, for an instance type, 100% CPU utilization means that all instances within that type are at 100% CPU utilization. The same is true for the account; metrics are summed for all instances.

Resource Manager collects monitoring information for the Account, Instance, and Instance Type objects. Account information appears on the Perf tab. Instance and Instance Type information appears on their main screens.

4.4.2. Templates and Collection

Resource Manager uses the standard monitoring template system to configure EC2 Manager accounts. Each template relies on a custom ZenCommand, `zencw2`, that polls the CloudWatch API and returns all available parameters. These parameters are used by their associated graphs. You can set thresholds against the parameters.

Templates for each primary object type are defined in the `/AWS/EC2` class.

Object Type	Template
Account	EC2Manager
Instance	EC2Instance
Instance Type	EC2InstanceType

Table 4.2. Primary Object Type Templates

4.4.2.1. Example: Initiating Load-Based Elasticity for an EC2 Setup

Suppose you want to use Resource Manager to initiate load-based elasticity for your EC2 setup. For example, each time the account CPU exceeds 80%, you want Resource Manager to create a new instance. To set up this scenario, you would first set up and model your account. Then, you would follow these steps:

1. Select the EC2Manager device in the Devices section of the Infrastructure page, and then expand the Monitoring templates node at the left of screen and click the EC2Manager template.
2. Add a threshold against the `zencw2_CPUUtilization` CPU Utilization data point, and then set its event class to `/Perf/CPU`.

Each time the CPU exceeds the threshold, Resource Manager creates an event with the device name EC2Manager in the `/Perf/CPU` class.

3. Create an event command that matches this event, and launch the EC2 command to create the new instances.

When the event is initiated, the new instances will be created.

Note

The `clear` command can be used to shut down unneeded instances.

Chapter 5. Apache Tomcat Application Server

5.1. About

The TomcatMonitor ZenPack allows you to monitor the Tomcat Application Server. Tomcat is a Web application container that conforms to many parts of the J2EE Specification.

This ZenPack focuses on the metrics that Tomcat updates in its internal MBean container that is accessible via the remote JMX API. These metrics focus on attributes that relate to the servicing of web pages and primarily include thread pool size, CPU use, available file descriptors, JSP and servlet counts, and request counts.

TomcatMonitor places much emphasis on monitoring thread status because every web request is serviced in a separate thread. Each thread requires file descriptors to be maintained, and thus those are monitored as well. The amount of CPU time spent servicing each thread is also captured and reported.

TomcatMonitor also reports on the number of times JSPs and Servlets are reloaded. This metric can be useful in highly dynamic sites where JSPs or Servlets change on the fly and need to be reloaded periodically. Monitoring of this metric can lead to the identification of small "Reloading Storms" before they cause production outages.

The amount of time Tomcat spends servicing a request is also recorded. This extremely high level metric can provide insight into downstream systems that are not monitored. If all the Tomcat resources are within normal tolerances but processing time suddenly spikes it can be an indication that a back-end service (such as a database or another web service) is misbehaving.

The following metrics can be collected and graphed:

- Tomcat cache (accesses vs hits)
- Daemon and User thread count
- Overall CPU time
- Global Request Traffic: bytes sent/received
- Global Request Traffic: request count and error count
- Global Request processing time
- JSP/Servlet reload time
- Servlet class loading and processing time
- Servlet request and error count

Tip

The more extensive JBoss Application Server uses Tomcat as a Web Application engine to manage web applications deployed inside enterprise applications within JBoss. As a result, the TomcatMonitor ZenPack can be used to monitor Tomcat MBeans that are active within JBoss.

5.2. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss Version 2.2 or higher
Required ZenPacks	ZenPacks.zenoss.ZenJMX, ZenPacks.zenoss.TomcatMonitor

Table 5.1. Tomcat Prerequisites

5.3. Enable Monitoring

5.3.1. Configuring Tomcat to Allow JMX Queries

Before running the Tomcat `bin/start.sh` script, run the following to allow unsecured queries against the Tomcat server:

```
JAVA_OPTS="-Dcom.sun.management.jmxremote.port=12346"
JAVA_OPTS="${JAVA_OPTS} -Dcom.sun.management.jmxremote.authenticate=false"
JAVA_OPTS="${JAVA_OPTS} -Dcom.sun.management.jmxremote.ssl=false"
export JAVA_OPTS
```

The same `JAVA_OPTS` approach can be used to enable remote access to Tomcat MBeans. Set the `JAVA_OPTS` variable as illustrated above and then execute the `./catalina.sh start` command in the `${TOMCAT_HOME}/bin` directory.

Note

Tomcat 6.0.14's `catalina.sh` does not process the `stop` command properly when the `JAVA_OPTS` variable is set. We recommend using two separate shell scripts when troubleshooting JMX problems in Tomcat: one for starting Tomcat (with the `JAVA_OPTS` variable set) and a different one for stopping Tomcat (where the `JAVA_OPTS` variable is not set).

If you add the above lines to the `bin/setenv.sh` (as seems to be the logical thing to do in `catalina.sh` to get the environment variables set up), the `bin/shutdown.sh` script will get those same environment variables. This will cause the `shutdown.sh` script to attempt to bind to the ports, fail, and then not stop Apache Tomcat.

5.3.2. Configuring Resource Manager

All Apache Tomcat services must have a device entry under the `/Devices/Server/Tomcat` device class.

Note

The `zenjmx` daemon must be configured and running. See Section 29.2.1, "Sun Java Runtime Environment (JRE)" for more information about configuring the `zenjmx` daemon with the Sun JRE tools.

1. Navigate to the device or device class under the `/Devices/Server/Tomcat` device class in the Resource Manager interface.
 - If applying changes to a device class:
 - a. Select the class in the devices hierarchy.
 - b. Click **Details**.
 - c. Select Configuration Properties.
 - If applying changes to a device:
 - a. Click the device in the device list.
 - b. Select Configuration Properties.
2. Edit the appropriate configuration properties for the device or devices.

Name	Description
<code>zTomcatJ2EEApplicationName</code>	Used to construct MBean names for a specific application deployed on Tomcat, typically used for JSP and Servlet statistics.
<code>zTomcatJ2EEServerName</code>	Used to construct MBean names for a specific application deployed on Tomcat, typically used for JSP and Servlet statistics.
<code>zTomcatJmxManagementAuthenticate</code>	This configuration property is deprecated.

Name	Description
zTomcatJmxManagementPassword	JMX password.
zTomcatJmxManagementPort	The port number used to gather JMX information.
zTomcatJmxManagementUsername	JMX username for authentication.
zTomcatListenHost	The hostname on which Tomcat is listening for web requests. This is used to construct MBean names.
zTomcatListenPort	The Tomcat connector, which is a port and protocol (http, jk...) that Tomcat is listening on. This is used to construct MBean names that monitor bytes, error and requests on that connector.
zTomcatServletName	Specific Servlet name to monitor.
zTomcatServletUri	URI of Servlet to monitor.
zTomcatWebAppUri	URI path for a Tomcat web application. Used to construct MBean names.

Table 5.2. Tomcat Configuration Properties

3. Click Save to save your changes.

You will now be able to start collecting the Tomcat server metrics from this device.

4. Navigate to Graphs and you should see some placeholders for performance graphs. After approximately fifteen minutes you should see the graphs start to become populated with information.

Tip

The out-of-the-box TomcatMonitor data source configuration has been defined at the macro level, but can be configured to operate on a more granular basis. For example, the Servlet Reload Count applies to all servlets in all web applications but it could be narrowed to be Servlet /submitOrder in web application "production server".

5.4. Change the Amount of Data Collected and Graphed

1. Navigate to the device or device class under the /Devices/Server/Tomcat device class in the Resource Manager interface.
2. From the left panel, select Monitoring Templates.
3. From the Action menu, select Bind Templates.
4. Move one or more templates to Selected, and then click **Save**.

Name	Description
Tomcat Cache	Cache information about a specific Web application deployed.
Tomcat Core	Core information about any Tomcat server: memory usage, threads, uptime, etc.
Tomcat Global Request Processor	Connection information over a Tomcat connector: bytes, errors, requests.
Tomcat JSPS	Metrics about a specific JSP page.
Tomcat Servlet	Metrics about a specific Servlet.
Tomcat Thread Pool	Threadpool metrics measured per Tomcat connector.
Tomcat Web Module	Processing time metrics for a Web module.

Table 5.3. Tomcat Templates

5. Click the OK button to save your changes.

5.5. Viewing Raw Data

See Section 29.5, “Using **JConsole** to Query a JMX Agent” for more information about how to investigate raw data returned from the application.

5.6. Daemons

Type	Name
Performance Collector	zenjmx

Table 5.4. Daemons

Chapter 6. Apache Web Server

6.1. About

The ApacheMonitor ZenPack provides a method for pulling performance metrics from the Apache Web server directly into Resource Manager, without requiring the use of an agent. This is accomplished by using Apache's `mod_status` module that comes with Apache Version 1 and 2.

The following metrics are collected and graphed for the Apache HTTP server.

- Requests per Second
- Throughput (Bytes/sec and Bytes/request)
- CPU Utilization of the HTTP server and all worker processes or threads
- Slot Usage (Open, Waiting, Reading Request, Sending Reply, Keep-Alive DNS Lookup, and Logging)

6.2. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss Version 2.2 or higher
Required ZenPacks	ZenPacks.zenoss.ApacheMonitor

Table 6.1. Apache Prerequisites

6.3. Enable Monitoring

Follow the steps in these sections to:

- Display the status page in Apache Version 1.3 or higher
- Display the status page in Apache Version 2.x
- Configure your configuration
- Configure the system to monitor the Web server

6.3.1. Display the Status Page in Apache Version 1.3 or Higher

1. On the Apache server, locate the `httpd.conf` file. Generally, this file is located at `/etc/httpd/httpd.conf` or `/etc/httpd/conf/httpd.conf`; however, other locations are possible depending on your operating system and setup.

If you cannot locate the configuration file, use your system's search facilities to locate it. For Windows, use the Search button of the Windows Explorer tool. For Unix, try the following command:

```
find / -name httpd.conf
```

2. Check to see that the following line is not commented out and is available in `httpd.conf` or `/etc/apache/modules.conf`:

```
LoadModule status_module /usr/lib/apache/1.3/mod_status.so
```

Note

You may have to search in alternate locations to find the `mod_status.so` file. Also, the syntax may differ depending on your configuration.

- Turn the `ExtendedStatus` option on in the `httpd.conf` file. This option is typically commented out. You can enable it by uncommenting it or ensuring that it is defined.

```
#ExtendedStatus on
```

becomes:

```
ExtendedStatus on
```

- Enable the `/server-status` location in the `httpd.conf` file. Typically, this option exists but is commented out.

```
#<Location /server-status>
#   SetHandler server-status
#   Order deny,allow
#   Deny from all
#   Allow from .example.com
#</Location>
```

becomes:

```
<Location /server-status>
SetHandler server-status
Order deny,allow
Deny from all
Allow from zenoss.example.com
</Location>
```

Note

Your Resource Manager server or servers must be able to connect to your Apache server. Ensure that it is listed here or is part of the network specified in this chunk of configuration.

To specify multiple servers, separate the entries with spaces. If you specify an IP address range rather than a destination, be sure to add a network mask to the end of the IP address range.

The following example allows a server called `externalzenoss.example.com`, as well as all servers that start with `192.168.10`, in their addresses:

```
<Location /server-status>SetHandler server-status
Order deny,allow
Deny from all
Allow from externalzenoss.example.com 192.168.10.0/24
</Location>
```

- Save the `httpd.conf` file with these changes and verify that the configuration file is correct. This can be accomplished with following command.

```
apachectl -t
```

Correct any issues before restarting Apache.

- Restart the Web server (`httpd`). This can be accomplished with following command.

```
apachectl restart
```

6.3.2. Display the Status Page in Apache Version 2.x

- On the Apache server, find the `httpd.conf` file. This is usually `/etc/apache2/apache2.conf` or `/etc/apache2/conf/httpd.conf`; however, other locations are possible depending on your operating system and setup.

If you are unsure about where your configuration file is located, use your system's search facilities to locate this file. Under Windows, use the Search button of the Windows Explorer tool. Under Unix, try the following command:

```
find / -name httpd.conf
```

2. Verify that the `mod_status` module is loaded.

```
apache% apachectl -M 2<&1 | grep status
status_module (shared)
```

The previous output indicates that the module is loaded and no further configuration is necessary. If there is no output, then copy the `mods-available/status.load` to the `mods-enabled` directory, and then run:

```
apache% /etc/init.d/apache2 force-reload
```

3. Turn the `ExtendedStatus` option on in the `httpd.conf` file. This option is typically commented out. You can enable it by uncommenting it or ensuring that it is defined.

```
#ExtendedStatus on
```

becomes:

```
ExtendedStatus on
```

4. Enable the `/server-status` location in the `httpd.conf` file. This is another option that typically already exists but is commented out.

```
#<Location /server-status>
#   SetHandler server-status
#   Order deny,allow
#   Deny from all
#   Allow from .example.com
#</Location>
```

becomes:

```
<Location /server-status>
SetHandler server-status
Order deny,allow
Deny from all
Allow from zenoss.example.com
</Location>
```

Note

Your Resource Manager server or servers must be able to connect to your Apache server so you must ensure that it is either listed here or is a part of the network specified in this chunk of configuration.

To specify multiple servers, separate the entries with spaces. If you would like to specify an IP address range rather than a destination, be sure to add a network mask to the end of the IP address range. The following example allows a server called `externalzenoss.example.com` as well as all servers that start with '192.168.10' in their addresses:

```
<Location /server-status>SetHandler server-status
Order deny,allowDeny from all
Allow from externalzenoss.example.com 192.168.10.0/24
</Location>
```

5. Save the `httpd.conf` file with these changes and verify that the configuration file is correct. This can be accomplished with following command.

```
apache2ctl -t
```

Correct any issues before restarting Apache.

- Restart the webserver (`httpd`). This can be accomplished with following command.

```
apache2ctl restart
```

6.3.3. Verifying Your Apache Configuration

Once Apache has been configured, you should verify that it is working correctly. To verify your Apache server, point your Web browser to your Apache server at the appropriately modified URL:

```
http://your-apache-server/server-status?auto
```

This is an example of what you might see:

```
Total Accesses: 1
Total kBytes: 2
Uptime: 43
ReqPerSec: .0232558
BytesPerSec: 47.6279
BytesPerReq: 2048
BusyWorkers: 1
IdleWorkers: 5
Scoreboard: _W_____
```

If there is a configuration issue, you should see an error message telling you that the page is forbidden.

Note

Your Resource Manager server or servers must be able to connect to your Apache server by using HTTP to receive information. This means that the Resource Manager server must be permitted not only by the Apache configuration settings, but also by any firewalls or proxies between the Resource Manager server and the Apache server, including any firewall on the Apache server. If there are any proxies, they must be configured to allow the Resource Manager HTTP traffic through. Consult your network administrator and security officer to verify the firewall configuration and your site's policies.

Further note that the name or IP address that your server has behind a firewall may be different than the IP address (some form of Network Address Translation (NAT)) or name resolution (the way that the external server resolves names may be through an Internet-visible DNS system rather than an intranet-only DNS system).

6.3.4. Configure Resource Manager to Monitor the Web Server

Once the Apache server is configured to allow Resource Manager to access the extended status, you can add Apache monitoring to the device within Resource Manager by binding the Apache template to the device.

- Select Infrastructure from the navigation bar.
- Click the device name in the device list.

The device overview page appears.

- In the left panel, expand Monitoring Templates, and then select Device.
- Select Bind Templates from the Action menu.

The Bind Templates dialog appears.

- Add the Apache template to the list of templates, and then click **Save**.

The Apache template is added. The system can now begin collecting the Apache server metrics from this device.

6.4. Daemons

Type	Name
Performance Collector	zencommand

Table 6.2. Daemons

Chapter 7. BEA WebLogic Application Server

7.1. About

WebLogicMonitor allows you to monitor a WebLogic Server. WebLogicMonitor uses the JMX Remote API and accesses MBeans deployed within WebLogic that contain performance information about the components that are being managed. This performance information includes pool sizes for data sources (JDBC), threads, connections (JCA), queues (JMS), servlets, JSPs, Enterprise Java Beans (EJB), timer queues.

Throughput is also monitored when it is available. This metric is computed by WebLogic and is based on the number of messages moving through a queue at any given time. The throughput metric gives a good picture of the health of the messaging subsystem, which is commonly used throughout many enterprise applications. Stateless, Stateful, and Entity EJB performance metrics are monitored, as are message driven bean performance.

Security realms are also monitored for potential denial of service attacks. This includes recording of authentication failures, broken out by valid accounts, invalid accounts, and accounts that are currently locked out. Application specific realms can be monitored by customizing the built in WebLogic default realm.

7.1.1. Overall Application Server Vitals

- Number of total and active JMS connections and servers
- Overall number of JTA transactions that are rolled back or abandoned
- JTA transactions rolled back due to system, application, or resource issues
- Number of JTA rollbacks that timeout
- Active and committed JTA transaction count
- Timer exceptions, executions, and scheduled triggers
- User accounts that are locked and unlocked
- Authentication failures against locked accounts and non-existent accounts
- Total sockets opened, and the current number of open sockets
- JVM Mark/Sweep and Copy garbage collector execution counts
- Number of JVM daemon threads
- JVM Heap/Non-Heap used and committed memory

7.1.2. Entity EJB, Message Driven Bean (MDB), and Session EJB Subsystem Metrics

- Rollback and commit count on a per-EJB basis
- Bean pool accesses, cache hits, and cache misses
- Number of Beans in use, idle, and destroyed
- Number of activations and passivations

7.1.3. Data Pool (JDBC) metrics

- Leaked, Total, and Active connections
- Number of requests waiting for a connection
- Number of reconnect failures

7.1.4. Queue (JMS) Metrics

- Bytes received, currently active, and pending in the queue
- Number of queue consumers
- Number of current, pending, and receives messages

7.2. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss Version 2.2 or higher
Required ZenPacks	ZenPacks.zenoss.ZenJMX, ZenPacks.zenoss.WebLogicMonitor
BEA WebLogic Versions	WebLogic 9.0 or higher

Table 7.1. BEA WebLogic Prerequisites

7.3. Enable Monitoring

7.3.1. Configuring WebLogic to Allow JMX Queries

If you have not set up a domain and server then run the **startWLS.sh** script located in the `${BEA_HOME}/wlserver_10.0/server/bin` directory. If you don't have the Terminal I/O package installed you can set the `JAVA_OPTIONS` variable to the following value:

```
JAVA_OPTIONS="-Dweblogic.management.allowPasswordEcho=true"
export JAVA_OPTIONS
```

Provide a user name and password to start WebLogic. Note that WebLogic requires a password that is at least eight characters long. Wait for WebLogic to generate a configuration and start up. Shut down WebLogic and restart it with remote JMX access enabled.

To enable remote JMX access set the following variable:

```
JAVA_OPTIONS="-Dcom.sun.management.jmxremote.port=12347"
JAVA_OPTIONS="${JAVA_OPTIONS} -Dcom.sun.management.jmxremote.authenticate=false"
JAVA_OPTIONS="${JAVA_OPTIONS} -Dcom.sun.management.jmxremote.ssl=false"
export JAVA_OPTIONS
```

Then re-run the **./startWLS.sh** script. **JConsole** can then communicate with the server on port 12347.

7.3.2. Configuring Resource Manager

All WebLogic services must have a device entry under the `/Devices/Server/WebLogic` device class.

Note

The **zenjmx** daemon must be configured and running. See Section 29.2.1, "Sun Java Runtime Environment (JRE)" for more information about configuring the **zenjmx** daemon with the Sun JRE tools.

1. Navigate to the device class or device.
 - If applying changes to a device class:

- a. Select the class in the devices hierarchy.
- b. Click **Details**.
- c. Select Configuration Properties.
- If applying changes to a device:
 - a. Click the device in the device list.
 - b. Select Configuration Properties.
2. Edit the appropriate configuration properties for the device or devices.

Name	Description
zWebLogicJmxManagementAuthenticate	This configuration property is deprecated
zWebLogicJmxManagementPassword	JMX password
zWebLogicJmxManagementPort	The port number used to gather JMX information
zWebLogicJmxManagementUsername	JMX username for authentication

Table 7.2. WebLogic Configuration Properties

3. Click Save to save your changes.

You will now be able to start collecting the WebLogic server metrics from this device.

4. Navigate to Graphs and you should see some placeholders for performance graphs. After approximately 15 minutes you should see the graphs start to become populated with information.

Tip

The out-of-the-box WebLogic data source configuration has been defined at the macro level, but can be configured to operate on a more granular basis. For example, the Servlet Reload Count applies to all servlets in all web applications but it could be narrowed to be Servlet /submitOrder in web application "production server".

7.4. Change the Amount of Data Collected and Graphed

1. Navigate to the device or device class.
2. Select Monitoring Templates in the left panel.
3. From the Action menu, select Bind Templates to display the Bind Templates dialog.
4. Move templates from the Available area to the Selected area, and then click **Save**.

Name	Description
WebLogic Core	Core information about any WebLogic server, including memory usage, threads, and uptime.
WebLogic JCA	
WebLogic JMS	
WebLogic JMS Destination	
WebLogic JTA	
WebLogic JTA Rollbacks	
WebLogic JVM	
WebLogic Thread Pool	Threadpool metrics measured per Tomcat connector

Name	Description
WebLogic Timer Service	
WebLogic User Lockouts	

Table 7.3. WebLogic Templates

- Click the OK button to save your changes.

7.5. Viewing Raw Data

See the Section 29.5, “Using **JConsole** to Query a JMX Agent” section for more information about how to investigate raw data returned back from the application.

7.6. Monitor SSL-Proxied WebLogic Servers

If you are monitoring a Web application running on a BEA WebLogic server you may find that the transaction always fails with a code 550 regardless of how you configure the script. This could be a result of the WebLogic server being behind an SSL proxy. When used in this configuration, WebLogic requires that a `WL-Proxy-SSL` header be added to the request so that it knows to redirect to HTTPS instead of HTTP.

To support this extra header in your Resource Manager Web transaction, you must make the following changes on the script tab of your WebTx data source.

- Remove any content from the Initial URL field.
- Add the following to the beginning of the Script box.

```
add_extra_header WL-Proxy-SSL true
go
```

7.7. Daemons

Type	Name
Performance Collector	zenjmx

Table 7.4. Daemons

Chapter 8. BIG-IP Network Devices

8.1. About

The BIG-IP network device monitoring feature monitors load balancer CPU and memory utilization. It also tracks per-instance metrics for each load-balanced virtual server that is configured.

8.2. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss Version 2.2 or higher
Required ZenPacks	ZenPacks.zenoss.BigIPMonitor

Table 8.1. BIG-IP Prerequisites

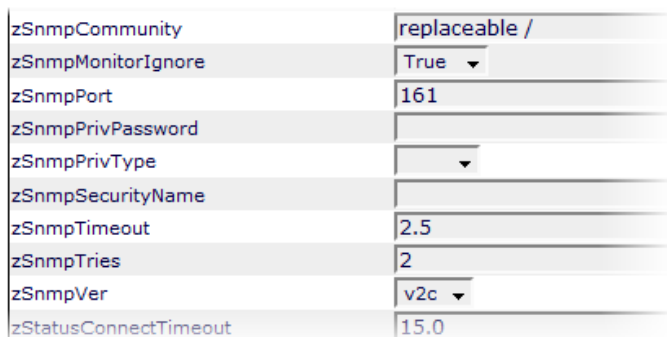

8.3. Enable Monitoring

To add a device and enable BIG-IP monitoring on it:

1. From Infrastructure, select Add a Single Device from  (Add Device).

The Add a Single Device page appears.

2. Enter a name for the device, and then select these values:
 - **Model Device** - De-select this option.
 - **Device Class** - Select `/Network/BIG-IP`.
3. Click **Add**.
4. Navigate to the newly created device.
5. Select Configuration Properties in the left panel.
6. Change the values of these configuration properties:
 - **zSnmpCommunity** - Enter the SNMP community string here.
 - **zSnmpVer** - Select `v2c`.

zSnmpCommunity	replaceable /
zSnmpMonitorIgnore	True ▾
zSnmpPort	161
zSnmpPrivPassword	
zSnmpPrivType	▾
zSnmpSecurityName	
zSnmpTimeout	2.5
zSnmpTries	2
zSnmpVer	v2c ▾
zStatusConnectTimeout	15.0

Figure 8.1. BIG-IP Configuration Properties Selections

7. Click **Save**.

8. Model the device. To do this, select Manage > Model Device from the page menu.

Resource Manager models the device. When modeling completes, you can view the device. After approximately fifteen minutes, you can verify that the performance graphs are updating.

8.4. Viewing Virtual Servers

To view the virtual servers, select BIG-IP details. Click a link in the table to view additional information for each load-balanced server.

8.5. Daemons

Type	Name
Modeler	zenmodeler
Performance Collector	zenperfsnmp

Table 8.2. Daemons

Chapter 9. Brocade SAN Switches

9.1. About

BrocadeMonitor allows you to monitor Brocade Storage Area Network (SAN) switches.

9.2. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss Version 2.2 or higher
Required ZenPacks	ZenPacks.zenoss.BrocadeMonitor, ZenPacks.zenoss.StorageBase

Table 9.1. Brocade Prerequisites

9.3. Enable Monitoring

9.3.1. Configuring Brocade Devices to Allow SNMP Queries

Configure the Brocade devices to allow SNMP queries from the Resource Manager server, and send SNMP v1 or SNMP v2 traps to the Resource Manager server.

9.3.2. Configuring Resource Manager

All Brocade devices must exist under the `/Devices/Storage/Brocade` device class.

1. Navigate to the device or device class in the Resource Manager interface.
 - If applying changes to a device class:
 - a. Select the class in the devices hierarchy.
 - b. Click **Details**.
 - c. Select Configuration Properties.
 - If applying changes to a device:
 - a. Click the device in the device list.
 - b. Select Configuration Properties.
2. Edit the appropriate configuration properties for the device or devices.

Name	Description
zSnmpCommunity	Consult with your storage administrators to determine the SNMP community permitted
zSnmpMonitorIgnore	This should be set to <code>False</code>
zSnmpPort	The default port is 161
zSnmpVer	This should be set to <code>v2c</code>

Table 9.2. Brocade Configuration Properties

3. Click Save to save your changes. You will now be able to start collecting the Brocade switch metrics from this device.

9.4. Viewing Fibre Channel Port Information

To view the virtual servers, select Brocade Details.

9.5. Daemons

Type	Name
Modeler	zenmodeler

Chapter 10. CheckPoint Firewalls

10.1. About

The CheckPointMonitor ZenPack allows you to monitor CheckPoint firewalls.

10.2. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss Version 2.2 or higher
Required ZenPacks	ZenPacks.zenoss.CheckPointMonitor

Table 10.1. CheckPoint Prerequisites

10.3. Enable Monitoring

10.3.1. Configuring CheckPoint Firewalls to Allow SNMP Queries

Configure the CheckPoint firewall to allow SNMP queries from the Resource Manager server, and to send SNMP v1 or SNMP v2 traps to the Resource Manager server.

10.3.2. Configuring Resource Manager

All CheckPoint devices must exist under the `/Devices/Network/Check Point` device class.

1. Navigate to the device or device class in the Resource Manager interface.
 - If applying changes to a device class:
 - a. Select the class in the devices hierarchy.
 - b. Click **Details**.
 - c. Select Configuration Properties.
 - If applying changes to a device:
 - a. Click the device in the device list.
 - b. Select Configuration Properties.
2. Edit the appropriate configuration properties for the device or devices.

Name	Description
zSnmpCommunity	Consult with your network administrators to determine the SNMP community permitted.
zSnmpMonitorIgnore	This should be set to <code>False</code>
zSnmpPort	The default port is 161
zSnmpVer	This should be set to <code>v2c</code>

Table 10.2. CheckPoint Configuration Properties

3. Click **Save** to save your changes.

You will now be able to start collecting the CheckPoint firewall metrics from this device.

4. Navigate to Graphs and you should see some placeholders for performance graphs. After approximately fifteen minutes you should see the graphs start to become populated with information.

10.4. Daemons

Type	Name
Modeler	zenmodeler
Performance Collector	zenperfsnmp

Table 10.3. Daemons

Chapter 11. Cisco Devices

11.1. About

The CiscoMonitor ZenPack allows you to monitor a variety of devices from Cisco Systems. Most Cisco devices are well-supported by the standard capabilities of Resource Manager. This ZenPack extends those basic capabilities to support modeling and monitoring of characteristics specific to Cisco devices.

11.2. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss Version 2.4 or higher
Required ZenPacks	ZenPacks.zenoss.CiscoMonitor

Table 11.1. Cisco Prerequisites

11.3. Enable Monitoring

Follow the steps in this section to configure your Cisco device and Resource Manager for monitoring.

11.3.1. Configuring Cisco Devices to Allow SNMP Queries

Configure the Cisco device to allow SNMP queries from the Resource Manager server, and send SNMP v1 or SNMP v2 traps to the Resource Manager server.

11.3.2. Configuring Resource Manager

All Cisco devices must be located in the `/Devices/Network/Cisco` device class.

1. Navigate to the device or device class in the Resource Manager interface.
 - If applying changes to a device class:
 - a. Select the class in the devices hierarchy.
 - b. Click **Details**.
 - c. Select Configuration Properties.
 - If applying changes to a device:
 - a. Click the device in the device list.
 - b. Select Configuration Properties.
2. Edit the appropriate configuration properties for the device or devices.

Name	Description
zSnmpCommunity	Consult with your network administrators to determine the SNMP community permitted.
zSnmpMonitorIgnore	Set to a value of <code>False</code> .
zSnmpPort	The default port is 161.

Name	Description
zSnmpVer	Set to a value of v2c.

Table 11.2. Cisco Configuration Properties

- Click Save to save your changes. Resource Manager now will collect Cisco device metrics from the configured device or devices.
- Navigate to Graphs and you should see some placeholders for performance graphs. After approximately 15 minutes you should see the graphs start to become populated with information.

11.4. Forwarding Syslog Messages to Resource Manager

For information about forwarding syslog messages from Cisco IOS routers and CatOS switches into Resource Manager, see Appendix C, "Syslog Device Preparation" in *Resource Manager Administration*.

11.5. Extended Capabilities for Cisco Devices

11.5.1. IOS

You should place Cisco devices running IOS in the `/Devices/Network/Cisco` device class. This lets them benefit from these extended monitoring capabilities:

- Modeling of hardware serial number. This information can be found in the details information for Cisco IOS devices.
- Monitoring of CPU and memory utilization. This information can be found on the Graph page for Cisco IOS devices.

- Modeling and monitoring of IP-SLA (RTTMON). This information can be found by navigating to the device, and then selecting Cisco Details from the left panel. menu.
- Modeling of stacked switch modules. This information can be found by navigating to the device, and then selecting Cisco Details from the left panel.

Stack Modules				Monitored <input type="checkbox"/>		
Name	Ports	Model	Serial #	Configuration	Status	
WS-C3560G-48TS:1	52	WS-C3560G-48TS	FOC1220Z4TX	Permanently Enabled	OK	

11.5.2. CatOS

You should place Cisco Catalyst devices running CatOS in the `/Network/Cisco/CatOS` device class. The only difference in this class is that the CPU and memory performance monitoring is done by using a different configuration. Otherwise, the devices are treated the same as IOS devices.

11.5.3. ASA, FWSM and PIX

You should place Cisco ASA, FWSM, and PIX devices in the `/Network/Cisco/ASA` device class. The only difference in this class is that the CPU and memory performance monitoring is done by using a different configuration. Otherwise, the devices are treated the same as IOS devices.

Resource Manager can encounter problems when querying Cisco PIX, ASA, and FWSM devices using SNMP. This is because, by default, Resource Manager tries to fit forty requests into a single SNMP packet when using SNMP v2c. This improves performance and reduces network and processing overhead on Resource Manager and the monitored device.

Common symptoms of this problem include:

- `DEBUG level /Perf/Snmp` events with a summary field of `Error reading value for "???"`
- Missing performance graphs.
- Errors similar to this that appear in the Cisco device log:

```
incoming SNMP request (? bytes) from IP address ?.?.?.? Port ? Interface
"inside" exceeds data buffer size, discarding this SNMP request.
```

11.5.4. Wireless LAN Controllers

You should place Cisco Wireless LAN Controllers in the `/Network/Cisco/WLC` device class. This lets them benefit from the following extended monitoring capabilities:

- Modeling of hardware model, serial number and operating system. This information can be found on the device Overview page.
- Modeling of individual access points controller by the wireless LAN controller. This information can be found by navigating to the wireless LAN controller device, and then selecting Wireless in the left panel.

11.5.5. ACE Load Balancers

You should place Cisco ACE (Application Control Engine) devices in the `/Network/Cisco/ACE` device class. This lets them benefit from the following extended monitoring capabilities:

- Modeling and monitoring of individual load balanced virtual servers. This information can be found by navigating to the device, and then selecting Cisco Details in the left panel.

11.5.6. Telepresence Codecs

You should place Cisco Telepresence Codec devices in the `/Network/Cisco/Codec` device class. This lets them benefit from the following extended monitoring capabilities:

- Modeling of hardware model, serial number and operating system. This information can be found on the overview page for Telepresence Codec devices.

- Modeling of all peripherals controlled by the codec. This information can be found by navigating to the Telepresence Code device, and then selecting Telepresence from the left panel.

11.6. Daemons

Type	Name
Modeler	zenmodeler
Performance Collector	zenperfsnmp

Table 11.3. Daemons

Chapter 12. Cisco UCS

12.1. About

The CiscoUCS ZenPack enables Resource Manager to use HTTP to monitor Cisco Unified Computing System (UCS) devices. Using Cisco's UCSTM™ Manager XML API, the system models and monitors devices placed in the `/CiscoUCS` device class.

The Cisco UCS ZenPack provides:

- Fabric interconnect monitoring
- Monitoring of equipment chassis and their compute blades
- Monitoring of service profiles, their compute blade assignments, and links to any other Resource Manager device from the UCS service profile on which it is running
- Full monitoring of events generated by the UCS

12.2. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss Version 2.5.2 or higher
Required ZenPacks	ZenPacks.zenoss.CiscoUCS, ZenPacks.zenoss.DynamicView

Table 12.1. Cisco UCS Prerequisites

12.3. Adding a Cisco UCS Device for Monitoring

Follow these steps to begin monitoring a Cisco UCS device through Resource Manager:

1. In the Resource Manager interface, navigate to the `/CiscoUCS` device class.
2. From , select Add Cisco UCS.

The Add Cisco UCS dialog appears.

Figure 12.1. Add Cisco UCS Unit

3. Enter information in the dialog:
 - **Hostname or IP Address** - Enter the host name or IP address of the UCS manager.
 - **Username** - Enter the user name of an authorized user.
 - **Password** - Enter the password to the user account.
 - **Port #** - By default, Resource Manager assumes a standard HTTP port of 80. Change this value as needed.
4. Click **Add Unit** to begin discovery.

12.4. UCS Monitoring Credentials

These configuration properties are populated automatically if you use the Add Cisco UCS dialog. (See the previous section, Adding a Cisco UCS Device for Monitoring.)

Name	Description
zCiscoUCSManagerUser	Username that will be used to access the Cisco UCS through the UCS Manager.
zCiscoUCSManagerPassword	Password to validate the username.
zCiscoUCSManagerPort	Port number used to monitor the Cisco UCS. The default value is 80.

Table 12.2. Cisco UCS Configuration Properties

12.5. Daemons

Type	Name
Modeler	zenmodeler
Performance Collector	zencommand
Event Monitoring	zenucsevents

Table 12.3. Daemons

Chapter 13. Datacenter View

13.1. About

Datacenter View is a visual representation of devices (such as a server or blade and device containers (such as a rack or chassis) in the system. Using this feature, you can create a custom view that represents a physical space (such as a data center) by customizing the view background. You can then overlay this view with active representations of your devices and device containers.

Figure 13.1. Custom View

For each device or device container, the system can generate a rack view, which diagrams the physical location of devices in a chassis or rack. Each represented device provides at-a-glance information about its status.

Figure 13.2. Rack View

13.2. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss Version 2.5.1 or later
Required ZenPacks	ZenPacks.zenoss.Diagram

Table 13.1. Datacenter View Prerequisites

Before a device or sub-location can appear in Datacenter View:

- At least one organizer must be configured
- At least one device or sub-organizer must be included in a location

To see the auto-generated rack view, you must set a rack slot value for the device. (For more information about this view, see the section titled *Activating the Auto-Generated Rack View*.)

13.3. Working with the List View

The List View provides a view of your devices (or, if configured, the Rack View).

Follow these steps to access the List View:

1. From the interface, select Infrastructure.
2. In the devices hierarchy, select a location, group, or system.
3. Click **Details**.
4. Select Diagram.

The List View appears.

Note

After you create a Custom View, that view appears by default.

13.4. Working with the Custom View

The Custom View lets you create a visual representation of your physical space (such as a data center).

To access the Custom View, from the Diagram selection, click Custom View.

You can edit the Custom View to:

- Add or change a background image
- Move or resize device images
- Remove the view

13.4.1. Adding a Background Image to the Custom View

Follow these steps to create a custom view and add a background image to the view:

1. From the Datacenter View page (accessed from the Diagram selection), click **Custom View**.
2. Click **Edit** to enable edit mode.

The Edit button highlights to indicate that it is active, and Options selections become available.

3. Select Options > Change Background.

The Change Background dialog appears.

4. Select Background Image from URL from the list of options.
5. Enter an image location in the Image URL field, and then click **Save**. Any image format and size supported by your browser can be used.

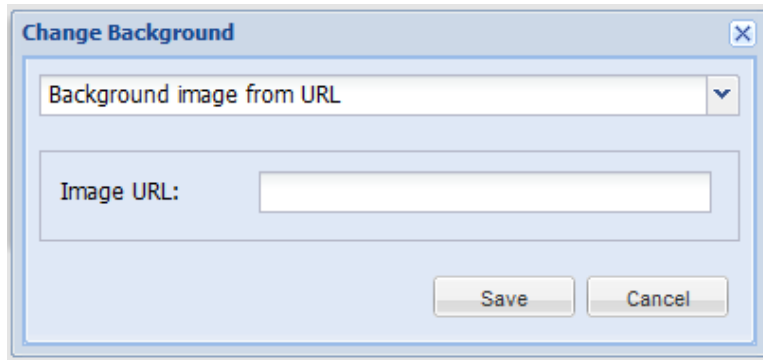

Figure 13.3. Change Background

13.4.1.1. Removing the Custom View Background Image

To remove the current background image from the Custom View:

1. From the Custom View area, click Edit.
2. Select Options > Change Background.
3. In the Change Background dialog, select No background image from the list of options.
4. Click **Save**.

The image no longer appears in the view.

13.4.2. Working with Devices in the Custom View

Devices in the custom view can be moved and resized. To work with devices in this view, click **Edit**. You can then drag devices to a specific location in the view, and resize them to accurately represent your physical space.

You also can view device details from this view. Click the device to go to its Status page.

Note

To access device status, you cannot be in edit mode.

13.4.3. Removing the Custom View

Removing the custom view removes the view and custom background image, if any. To remove a custom view:

1. From the Datacenter View page (accessed from the Diagram selection), click **Custom View**.
2. Click Edit to enable edit mode.
3. Select Options > Remove Custom View.

The custom view no longer appears by default. If you select Custom View, devices still appear in the view; however, they are reset to default positions and sizes.

13.5. Activating the Auto-Generated Rack View

First, ensure that the device is included in a location. Then follow these steps to make devices visible in Datacenter View.

1. Edit the device you want to make visible. From the list of Devices, select a device (in the illustration, beta.zenoss.loc), click **Details**, and then select Edit.
2. Enter values for Rack Slot, in the format:

$ru=n, rh=n, st=n$

where:

- $ru=n$ sets the value for rack unit (the lowest unit used by the device)
- $rh=n$ sets the value for rack height (the number of units the device uses in the rack)
- $st=n$ sets the value for rack slot
- $sc=n$ sets the value for slot capacity (set only for chassis devices)

For example, values of:

$ru=2, rh=1$

establishes a device visually in the rack as shown in this illustration:

Figure 13.4. Setting Rack Slot Value

Note

In the example, a rack slot value is not needed, as there is only one device.

3. Click **Save**.

The device appears in Datacenter View. In the List View, it appears as part of a rack illustration. (The rack illustration is now the default image in the List View.)

In the Custom View, it appears as a single device image.

Note

You can customize this device image by modifying the `zlcon` configuration property in the device class.

Chapter 14. Dell Hardware

14.1. About

The DellMonitor ZenPack provides custom modeling of devices running the Dell OpenManage agents. It also contains hardware identification for Dell proprietary hardware. The information is collected through the SNMP interface.

The following information is modeled:

- Hardware Model
- Hardware Serial Number
- Operating System
- CPU Information (socket, speed, cache, voltage)
- PCI Card Information (manufacturer, model)

14.2. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss 2.2 or higher
Required ZenPacks	ZenPacks.zenoss.DellMonitor
On each remote device	The Dell OpenManage SNMP Agent is used to gather information about the device.

Table 14.1. Dell Hardware Prerequisites

14.3. Enable Enhanced Modeling

To enable modeling:

1. Select Infrastructure from the navigation bar.
2. Click the device name in the device list.

The device overview page appears.

3. Select Modeler Plugins from the left panel.
4. Click Add Fields to reveal the list of available plugins.
5. Select the following plugins from the Available fields list, and then drag them to the Plugins list:
 - DellCPUMap
 - DellDeviceMap
 - DellPCIMap
6. Remove the following plugins by clicking on the 'X' button located to the right of the plugin.
 - zenoss.snmp.CpuMap
 - zenoss.snmp.DeviceMap
7. Click Save to save the updates.
8. Remodel the device using these new plugins by selecting Model Device from the Action menu.

14.4. Daemons

Type	Name
Modeler	zenmodeler
Performance Collector	zenperfsnmp

Table 14.2. Daemons

Chapter 15. Device Access Control Lists

15.1. About

The Device Access Control List (ACL) Enterprise ZenPack (ZenDeviceACL) adds fine-grained security controls to Resource Manager. You can use this control to limit access to data, such as limiting access to certain departments within a large organization, or limiting a customer of a service provider to see only his own data.

A user with limited access to objects also has a more limited view of features within the system. Most global views, such as the network map, event console, and all types of class management, are not available. The Device List is available, as are the device organizers Systems, Groups, and Locations. A limited set of reports can also be accessed.

15.2. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss 2.2 or higher
Required ZenPacks	ZenPacks.zenoss.ZenDeviceACL

Table 15.1. Device ACL Prerequisites

15.3. Key Concepts

15.3.1. Permissions and Roles

Actions in Resource Manager are assigned permissions. For example, to access the device edit screen you must have the "Change Device" permission. Permissions are not assigned directly to a user, but granted to roles, which are then assigned to a user. A common example is the ZenUser role. Its primary permission is "View," which grants read-only access to all objects.

ZenManagers have additional permissions, such as "Change Device," which grants users with this role access to the device edit screen. When you assign a role to a user (using the Roles field on the Edit tab), it is assigned globally. When creating a restricted user you may not want to give that user a global role.

For more information about Resource Manager roles, refer to *Resource Manager Administration*.

15.3.2. Administered Objects

Device ACLs provide limited control to various objects in the system. Administered objects are the same as device organizers (groups, systems, locations, and devices). If access is granted to any device organizer, it extends to all devices in that organizer.

To assign access to objects for a restricted user, you must be assigned the Manager or ZenManager role. Resource Manager grants access to objects by using the "Administered Objects" selection for a user or user group. To limit access, you must not assign a "global" role to the user or group.

15.3.3. Users and Groups

Users and user groups work exactly as they would normally. See the chapter titled "Managing Users" in *Resource Manager Administration* for more information about managing users and groups.

15.3.4. Assigning Administered Object Access

For each user or group there is selection called "Administered Objects." The Action menu has an "Add" item for each type of administered object. Adding an object will bring up a dialog box with live search on the given type of object.

After adding an object, you can assign it to a role. Roles can be different for each object. For example, a user or group might have the ZenUser role assigned to a particular device but the ZenManager role assigned to a location organizer. If multiple roles are granted to a device through direct assignment and organizer assignment, the resulting permissions will be additive. For the previously cited example, if the device is within the organizer the user will inherit the ZenManager role on the device.

15.3.5. Restricted Screen Functionality

15.3.5.1. Dashboard

By default, the dashboard is configured with three portlets:

- Object Watch List
- Device Issues
- Production State

These have content that are restricted to objects for a given user.

15.3.5.2. Device List

The device list is automatically filtered to devices of a restricted user, scoped to accessible devices. There are no menu items available.

15.3.5.3. Device Organizers

Device organizers control groups of devices for a restricted user. Each device added to the group will be accessible to the user. Permissions are inherited through multiple tiers of a device organizer.

15.3.5.4. Reporting

Reports are limited to device reports and performance reports.

15.3.5.5. Viewing Events

A user in restricted mode does not have access to the global event console. The available events for the user can be seen under his organizers.

15.4. Create a User Restricted to Specific Devices

1. As admin or any user account with Manager or ZenManager role, create a user named `actest`. Set a password for the user.
2. From the user's Edit page, make sure that no role is assigned.
3. Select the user's Administered Objects page.
4. From the Action menu, select the "Add Device..." item and add an existing device to that user.

The device's role defaults to ZenUser.

5. Log out of your browser, or open a second browser and then log in as `actest`.
6. Go to Infrastructure > Devices.

You should see only the device you assigned to acltest.

7. Navigate to the device and notice that the Edit selection is not available. This is because you are in read-only mode for this device.

15.5. Create a Manager Restricted to Specific Devices

Following the previous example:

1. Go back to the acltest user's Administered Objects and set the role on the device to ZenManager.
2. As acltest, navigate to the device. You now have access to the Edit page.

15.6. Adding Device Organizers

1. Go to the Groups root and create a group called "RestrictGroup."
2. Go to the acltest user's Administered Objects and add the group to the user.
3. Logged in as acltest, notice that the Navigation menu has the Groups item. Group can be added to a user.
4. Place a device within this group and as acltest you should not only see the device within the group but also in the device list.

15.7. Restricted User Organizer Management

1. Assign the acltest user the ZenManager role on your restricted group.
2. As acltest, you can now add sub-organizers under the restricted group.

Chapter 16. Distributed Collector

16.1. About Distributed Collector

Distributed Collector allows you to deploy additional performance collection and event monitoring daemons to the Resource Manager server or other servers. Doing this allows you to:

- Distribute processor, disk, and network load across multiple servers.
- Collect performance and events from networks that cannot be reached by the Resource Manager server.
- Configure more than one set of monitoring settings, such as different cycle times, for the `zenperfsnmp` daemon.

When you first install Distributed Collector, Resource Manager is configured with one hub and one collector. You cannot delete the initial hub and collector (each named `localhost`) that are set up by Distributed Collector.

16.1.1. About Collectors

A *collector* is a set of collection daemons, on the Resource Manager server or another server, that shares a common configuration. That configuration contains values, such as:

- Number of seconds between SNMP collections cycles
- Default discovery networks
- Maximum number of `zenprocess` parallel jobs

Each collector has its own copy of each of the Resource Manager collection daemons. For example, Resource Manager initially contains collection daemons with names like `zenperfsnmp`, `zenprocess`, and `zenping`. If you create a new collector named `My2ndCollector`, then the system creates new daemons named `My2ndCollector_zenperfsnmp`, `My2ndCollector_zenprocess`, and `My2ndCollector_zenping`.

16.1.2. About Hubs

Distributed Collector also allows you to set up new hubs. A *hub* represents an instance of the `zenhub` daemon, through which all collector daemons communicate with the object and event databases.

All collectors must belong to exactly one hub; however, a hub can have many collectors associated with it. All hubs (and indirectly all collectors) refer to the same object and event databases. Typically, only very large systems with more than five collectors (or more than 1,500 devices) benefit from multiple hubs.

Hubs manage configuration data and pass it to the collectors. Hubs also take data from the collectors and pass it to the Zenoss DataStore. Multiple hubs can be a more efficient way to manage larger deployments, as they help distribute the computing resources when configuration changes are made. They further remove the potential for configuration changes to be a bottleneck to gathering and processing data.

16.1.3. Typical Usage Scenarios for Distributed Monitoring

The correct distributed strategy for your environment depends on network security restrictions, as well as scale. Contact Zenoss Support if you are unsure which option best suits your enterprise.

Typical setup scenarios for using multiple hubs and collectors are shown in the following table:

Hub	Collector	Description
Local hub	Local collector	This setup requires only a single server, and is the most common Resource Manager deployment type. You would most likely use this configuration if you need to monitor fewer than 1000 devices, and your master Re-

Hub	Collector	Description
		source Manager server has direct network access to all of the monitored devices.
Local hub	Remote collector	This setup requires two servers, and is the most basic distributed setup. The primary benefit of this configuration over the local hub/local collector configuration is that the master server does no collection. This frees resources, optimizing the server's ability to perform its central role of database server and Web interface.
Local hub	Multiple remote collectors	This is the most common distributed Resource Manager configuration. You might use this configuration to scale Resource Manager to monitor more than 1000 devices. Depending on the hardware of the collectors, it is possible to monitor up to 1000 devices for each collector using this configuration. You might also use this configuration to handle differing network security policies. Often, your master Resource Manager server will not have access to all of the devices you need to monitor. In this case you can set up a remote collector with the required network access.
Multiple remote hubs	Multiple remote collectors	This configuration is for large installations only. For cases in which you have more than five collectors, you should consider deploying one or more hub servers to handle them.

Table 16.1. Distributed Monitoring Use Scenarios

16.1.4. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss Version 2.4 or higher
Required ZenPacks	ZenPacks.zenoss.DistributedCollector

Table 16.2. Distributed Collector Prerequisites

16.1.5. Navigating Collectors and Hubs

To view and manage collectors and hubs:

1. Log in as the Resource Manager user.
2. From the navigation menu, select Advanced > Collectors.

The Collectors page appears.

Name	Creation Time	Last Modification
<input type="checkbox"/> localhost	2011/07/28 19:55:11	2011/07/28 19:56:43
localhost	2011/06/24 15:36:42	2011/07/28 19:56:43

Figure 16.1. Collectors Page

The page lists existing hubs and collectors in hierarchical form. Hubs are listed at the top level; collectors are nested below the hub to which they belong.

From this page, you can:

- Add a hub
- Delete a hub (which also deletes its associated collectors)
- View and edit hub settings
- Configure associated monitoring templates

Select a hub to display details and configuration options. From here, you can:

- Update a hub
- Add and delete collectors

The screenshot shows the 'Collectors > localhost' page. The left sidebar has 'Overview' selected. The main content area is divided into two sections: 'Hub Configuration' and 'Zenoss Collectors'. The 'Hub Configuration' section shows fields for Hostname (localhost), ZenHub Port (8789), XML-RPC Port (8081), and ZEO Host (localhost). The 'Zenoss Collectors' section shows a table with columns for Name, Creation Time, and Last Modification. A single collector named 'localhost' is listed with a creation time of 2011/06/24 15:36:42 and a last modification time of 2011/07/28 20:29:45.

Name	Creation Time	Last Modification
<input type="checkbox"/> localhost	2011/06/24 15:36:42	2011/07/28 20:29:45

Figure 16.2. Collectors Page - Overview

In the left panel, select Daemons to display details about the `zenhub` daemon that belongs to the collector. Links adjacent to the daemon name allow you to view the daemon log, and view and edit its configuration. Use the buttons to the right of the daemon name to stop, start, and restart it.

The screenshot shows the 'Collectors > localhost' page with 'Daemons' selected in the left sidebar. The main content area shows a table of Zenoss Daemons. The 'zenhub' daemon is listed with PID 22974, a green status indicator, and links for 'view log', 'view config', and 'edit config'. There are also 'Restart' and 'Stop' buttons.

Zenoss Daemon	PID	Log File	Configuration	State	Actions
zenhub	22974	view log	view config edit config	●	Restart Stop

Figure 16.3. Collectors Page - Daemons

16.2. Deploying Collectors

The following sections offer information and procedures for:

- Installing prerequisites
- Deploying remote collectors
- Deploying local collectors

16.2.1. Installing Prerequisite Packages

Install these packages on the RHEL 5 or CentOS 5 server that will become the collector. Use the following command:

```
yum -y install mysql-client net-snmp net-snmp-utils gmp libgomp libgcj liberation-fonts
```

16.2.2. Deploying Remote Collectors

The following sections provide detailed information needed to deploy remote collectors:

- Requirements
- Limitations
- Deployment

16.2.2.1. Requirements

Remote collector deployments must meet these requirements:

- The operating system running on the server to be deployed as a remote collector must be the same version and platform as that running on the Resource Manager master. (For example, if your Resource Manager master is CentOS 5 32-bit, then the collector must also be CentOS 5 32-bit.)
- By default, port 8789 must be open so that the collector and ZenHub can communicate (both ways). This may differ if you have configured ZenHub to run on a different port.
- The Resource Manager server hostname must be a resolvable, fully qualified domain name or IP address.
- You must update all collectors after you:
 - Update your version of Resource Manager
 - Install patches
 - Install, update, or remove ZenPacks

16.2.2.2. Limitations

The system is not compatible with Security-Enhanced Linux (SELinux) in enforcing mode. You must disable enforcing mode for all platforms running the Resource Manager daemons (Resource Manager master, remote hubs, and remote collectors).

To disable enforcing mode:

1. Edit the `/etc/selinux/config` file.
2. Set the following line:

```
SELINUX=disabled
```

Note

You also can disable enforcing mode temporarily (avoiding the need to reboot) with the command:

```
echo 0 > /selinux/enforce
```

For more information about SELinux, browse to <http://en.wikipedia.org/wiki/SELinux>, or to the SELinux home page at <http://www.nsa.gov/research/selinux/index.shtml>.

16.2.2.3. Deployment

Follow these steps to deploy a remote collector:

1. Browse to the Resource Manager master, and then log in to the user interface.
2. Select **Advanced > Collectors** from the navigation bar.
3. Click the name of the hub for your Resource Manager master. (In a default installation, this is `localhost`.)
4. On the Overview page, select **Add Collector** from the Action menu.

The Add Collector page appears. From here, you can use one of several methods to access the remote host.

16.2.2.3.1. Root User Password

Follow these steps to install a remote collector using a root password for access to the remote host.

Note

You must set a password for the root user on a server before deploying a collector to it.

1. Select the Install remotely option.
2. Select the root password option.

The screenshot shows a web form titled "Add Collector". Under the "Install remotely" section, the "root user password" option is selected. Below this, there is a text box containing instructions: "Install an additional collector on a remote host using the root password for the remote host. Root and zenoss user SSH keys will be established to access the remote host." This text box contains three input fields: "Collector ID:", "Host:", and "Root Password:". At the bottom of the form is a button labeled "ADD COLLECTOR".

Figure 16.4. Install Remote Collector (Root Password)

3. Enter or change setup details:

Field Name	Description
Collector ID	Enter the name for the collector as it will be identified in the system. This name will be used to prefix the control scripts on the collector. If the ID is <code>coll11</code> , then scripts will be named <code>coll11_zenperfsnmp</code> .
Host	Enter the name of the host for the collector. This must be a fully qualified domain name, IP address, or resolvable hostname.
Root Password	Enter the password for the root user on the Host. The root password is not stored; it is used to configure a pre-shared key between the main server and the remote collector.

Table 16.3. Add New Collector Fields

Note

If you are creating another collector on the server, enter the `localhost` rather than the IP address of the server.

- Click **Add Collector**. The system displays log output from the creation of the new collector. When fully configured (this may require several minutes), The system displays the final entry "navigate to *CollectorName*." Click the link to go to the overview page for the new collector.

16.2.2.3.2. Root SSH Keys

To install a remote collector, using existing root SSH keys for access to the remote host:

- Select the Install remotely option.
- Select the root SSH keys option.

The screenshot shows a web interface titled "Add Collector". Under the "Install remotely" section, the "root user SSH keys" option is selected. Below this, there is a text box with instructions: "Install an additional collector on a remote host using a pre-existing root SSH key for the remote host. Zenoss user SSH keys will be established to access the remote host." This text box contains two input fields: "Collector ID:" and "Host:". At the bottom of the form is a button labeled "ADD COLLECTOR".

Figure 16.5. Install Remote Collector (Root SSH Keys)

- Enter or change setup details:

Field Name	Description
Collector ID	Enter the name for the collector as it will be identified in the system. This name will be used to prefix the control scripts on the collector. If the ID is <code>coll11</code> , then scripts will be named <code>coll11_zenperfsnmp</code> .
Host	Enter the name of the host for the collector. This must be a fully qualified domain name, IP address, or resolvable hostname.

Table 16.4. Add New Collector Fields

Note

If you are creating another collector on the server, enter the `localhost` rather than the IP address of the server.

- Click **Add Collector**. The system displays log output from the creation of the new collector. When fully configured (this may require several minutes), the system displays the final entry "navigate to *CollectorName*." Click the link to go to the overview page for the new collector.

16.2.2.3.3. Resource Manager SSH Keys

If you choose to set up a collector using Resource Manager SSH keys, the system will attempt to install by using the zenoss user. To successfully install a collector using these keys (without root access), these prerequisite conditions must be met:

- zenoss user SSH keys must be set up between the Resource Manager server and the target.
- You must be running the RPM distribution.
- Resource Manager core RPM must be installed on the target (remote) machine.

Tip: When installing the RPM on the remote machine, **do not start** the system.

Follow these steps to install a remote collector, using Resource Manager SSH keys for access to the remote host.

Note

For detailed steps for creating SSH keys, see the section titled "Setting Up SSH Keys for Distributed Collector."

1. Select the Install remotely option.
2. Select the zenoss SSH Keys option.

Figure 16.6. Install Remote Collector (Resource Manager SSH Keys)

3. Enter or change setup details:

Field Name	Description
Collector ID	Enter the name for the collector as it will be identified in the system. This name will be used to prefix the control scripts on the collector. If the ID is <code>coll1</code> , then scripts will be named <code>coll1_zenperfsnmp</code> .
Host	Enter the name of the host for the collector. This must be a fully qualified domain name, IP address, or resolvable hostname.

Table 16.5. Add New Collector Fields

Note

If you are creating another collector on the server, enter the `localhost` rather than the IP address of the server.

4. Click **Add Collector**. The system displays log output from the creation of the new collector. When fully configured (this may require several minutes), The system displays the final entry "navigate to *CollectorName*." Click the link to go to the overview page for the new collector.

16.2.3. Deploying Local Collectors

Follow these steps to install a local collector:

1. Browse to the Resource Manager master, and then log in to the user interface.
2. Select Advanced > Collectors from the navigation bar.
3. Click the name of the hub for your Resource Manager master. (In a default installation, this is `localhost`.)
4. On the Overview page, select Add Collector from the Action menu.

The Add Collector page appears.

5. Select the Install locally option.

The screenshot shows the 'Add Collector' page with the following elements:

- A header bar labeled 'Add Collector'.
- Two radio button options: 'Install remotely' (unselected) and 'Install locally' (selected).
- Under 'Install remotely', three sub-options are listed: 'root user password', 'root user SSH keys', and 'zenoss user SSH keys'.
- A light blue box containing the text: 'Install an additional collector on the local Resource Manager Master.' Below this text is a text input field labeled 'Collector ID:'.
- A dark button labeled 'ADD COLLECTOR' at the bottom.

Figure 16.7. Install Locally

6. Enter or change setup details:

Field Name	Description
Collector ID	Enter the name for the collector as it will be identified in the system. This name will be used to prefix the control scripts on the collector. If the ID is <code>coll11</code> , then scripts will be named <code>coll11_zenperfsnmp</code> .

Table 16.6. Add New Collector Fields

7. Click **Add Collector**. The system displays log output from the creation of the new collector. When fully configured (this may require several minutes), click the link at the bottom of the page to go to the overview page for the new collector.

16.3. Updating Collectors

You must update all collectors after you:

- Update your version of Resource Manager
- Install patches
- Install, update, or remove ZenPacks

To update a collector:

1. From the navigation menu, select Advanced > Collectors.
2. Select the collector to display its Overview page.
3. Select Update Collector from the Action menu.

Resource Manager copies the most recent code and ZenPacks to the server, and restarts the daemons running there.

16.4. Backing Up Remote Collector Performance Data

Resource Manager does not automatically back up remote collector performance data (RRD files). To back up this data, set up a `cron` job on the remote collector. The `cron` job should invoke `zenbackup` with these options:

```
zenbackup --no-eventsdb --no-zodb
```

Old backup data is not automatically deleted; therefore, the backup solution you use to save the data should remove the backup file when it is no longer needed.

16.5. Deleting Collectors

When you delete a collector, its devices are left without an assigned collector. Zenoss recommends that you reassign assigned devices prior to deleting a collector.

To delete a collector, click the name of the hub where the collector exists from the main collectors page. The Hub overview page appears. From the list of Resource Manager Collectors, select the collector you want to delete. From the Action menu, select Delete Collector.

When you delete collectors using this Resource Manager instance, they are not removed or "uninstalled" in any way from the collector device. They continue to exist on the device until manually removed through the file system.

16.6. Adding Devices to Collectors

Adding devices to collectors occurs when you add the device to Resource Manager.

1. Select Add a Single Device from  (Add Device).

The Add a Single Device page appears.

2. From the Collector list of options, select the collector you want to use to collect data for the device.

After you select the collector, the device appears in the Devices list, located at the bottom of the collector overview page.

16.6.1. Moving Devices Between Collectors

You can move devices from one collector to another.

1. Select one or more device rows in the device list.
2. Select Set Collector from the Actions list of options.
3. Select a collector, and then click **OK**.

Resource Manager moves the devices to the selected collector.

Note

When a device is moved between collectors, the performance data is not moved. As a result, historical data for the device may not appear in reports and graphs.

16.7. Managing the Collector Daemons

Collector daemons appear on the Daemons page for each collector, and can be started, stopped and restarted from there.

16.8. Deploying Hubs

The following sections offer information and procedures for:

- Installing prerequisites
- Deploying remote hubs

16.8.1. Installing Prerequisites

1. Install the Zenoss DataStore. Depending on your architecture, use one of these commands:

- 32-bit:

```
rpm -ivh zends-5.5.13-1.Version.el5.i386.rpm
```

- 64-bit:

```
rpm -ivh zends-5.5.13-1.Version.el5.x86_64.rpm
```

2. Install these packages on the RHEL 5 or CentOS 5 server that will become the hub. Use the following command:

```
yum -y install mysql-client net-snmp net-snmp-utils gmp libgomp libgcj liberation-fonts
```

16.8.2. Deploying Remote Hubs

The following sections provide detailed information needed to deploy hubs:

- Requirements
- Limitations
- Configuring Zenoss DataStore
- Deployment

16.8.2.1. Requirements

Hub deployments must meet these requirements:

- The Resource Manager server hostname must be a resolvable, fully qualified domain name or IP address.
- Any server hosting a remote hub must have the Zenoss DataStore installed (but not running). The Zenoss DataStore is needed for a client library that allows MySQL connections.
- Remote hubs need to communicate on these default Resource Manager ports:

- Port 13306 - Zenoss DataStore
- Port 8084 - Resource Manager events system
- Port 5672 - Resource Manager queuing system
- You must update all hubs after you:
 - Update your version of Resource Manager
 - Install patches
 - Install, update, or remove ZenPacks

16.8.2.2. Limitations

The system is not compatible with Security-Enhanced Linux (SELinux) in enforcing mode. You must disable enforcing mode for all platforms running the Resource Manager daemons (Resource Manager master, remote hubs, and remote collectors).

To disable enforcing mode:

1. Edit the `/etc/selinux/config` file.
2. Set the following line:

```
SELINUX=disabled
```

Note

You also can disable enforcing mode temporarily (avoiding the need to reboot) with the command:

```
echo 0 > /selinux/enforce
```

For more information about SELinux, browse to <http://en.wikipedia.org/wiki/SELinux>, or to the SELinux home page at <http://www.nsa.gov/research/selinux/index.shtml>.

16.8.2.3. Configuring MySQL for Remote Hubs

Hubs on remote servers need access to the Zenoss DataStore. By default this is set to localhost, but will not work for remote hubs. Distributed collector attempts to set this field to the fully qualified domain name of the Resource Manager server when it is installed. If remote hubs appear to be having trouble connecting to the Zenoss DataStore, then check the host value in `$ZENHOME/etc/global.conf` to make sure it can be reached from the server the hub is on.

Another aspect of remote hubs connecting to the Zenoss DataStore is privileges. For a hub to connect to the database, the user specified in the `$ZENHOME/etc/global.conf` file for `mysqluser` must be granted privileges to connect to the Zenoss DataStore from the remote server. If a remote hub is logging error messages that indicate it is not allowed to connect from the given host, then these privileges are likely not set up correctly. Granting of these privileges requires a fully qualified domain name for the remote server.

Before adding a hub, ensure grants and permissions are set correctly. For your Resource Manager master, run these commands:

```
GRANT SELECT on mysql.user to zenoss@'%' IDENTIFIED BY "zenoss";
GRANT ALL PRIVILEGES ON zenoss_zep.* to zenoss@'%' IDENTIFIED BY "zenoss";
GRANT ALL PRIVILEGES ON zodb.* to zenoss@'%' IDENTIFIED BY "zenoss";
FLUSH PRIVILEGES;
```

For every remote Zenhub server, run these commands in the Zenoss DataStore, replacing *RemoteHubFQDN* with the appropriate hostname for each server:

```
GRANT SELECT on mysql.user to zenoss@'RemoteHubFQDN' IDENTIFIED BY "zenoss";
```

```
GRANT ALL PRIVILEGES ON zenoss_zep.* to zenoss@'RemoteHubFQDN' IDENTIFIED BY "zenoss";
GRANT ALL PRIVILEGES ON zodb.* to zenoss@'RemoteHubFQDN' IDENTIFIED BY "zenoss";
FLUSH PRIVILEGES;
```

16.8.2.4. Deployment

When deploying a remote hub, you can select one of several options, using:

- Root password to the remote host
- Pre-existing root SSH keys
- Resource Manager SSH keys (use only for RPM installations)

To add a hub, from the main Collectors page, select Add Hub from the Action menu.

The Add Hub page appears.

16.8.2.4.1. Install Remotely (Root Password)

Follow these steps to install a remote hub, using a root password for access to the remote host.

Note

You must set a password for the root user on a server before deploying a hub to it.

1. Select the root password option.

Figure 16.8. Install Remote Hub (Root Password)

2. Enter or change setup details:

- **Hub ID** - Enter a name for the new hub. The name can be any unique combination of letters, digits, and dashes.
- **Host** - Enter the fully qualified domain name, IP address, or resolvable hostname of the server on which the new hub will run.

- **Root Password** - Enter the root user password for the server you specified in the Host field.
 - **Port** - Enter the port number on which the hub should listen for collectors. The default port is 8790.
 - **Hub Password** - Enter the hub password that the collectors will use to log in to this hub. The default password is "zenoss."
 - **XML RPC Port** - Specify the port on which the hub should listen for xml-rpc requests from the collectors or other API clients.
3. Click **Add Hub**.

The system displays log output from the creation of the new hub. When fully configured (this may require several minutes), click the link at the bottom of the page to go to the overview page for the new hub.

16.8.2.4.2. Install Remotely (Root SSH Keys)

To install a remote hub, using existing root SSH keys for access to the remote host:

1. Select the root SSH keys option.

Figure 16.9. Install Remote Hub (Root SSH Keys)

2. Enter or change setup details:
 - **Hub ID** - Enter a name for the new hub. The name can be any unique combination of letters, digits, and dashes.
 - **Host** - Enter the fully qualified domain name, IP address, or resolvable hostname of the server on which the new hub will run.
 - **Port** - Enter the port number on which the hub should listen for collectors. The default port is 8790.
 - **Hub Password** - Enter the hub password that the collectors will use to log in to this hub. The default password is "zenoss."
 - **XML RPC Port** - Specify the port on which the hub should listen for xml-rpc requests from the collectors or other API clients.
3. Click **Add Hub**.

The system displays log output from the creation of the new hub. When fully configured (this may require several minutes), click the link at the bottom of the page to go to the overview page for the new hub.

16.8.2.4.3. Install Remotely (zenoss SSH Keys)

If you choose to set up a hub using zenoss SSH keys, Resource Manager will attempt to install by using the zenoss user. To successfully install a hub using these keys (without root access), these prerequisite conditions must be met:

- zenoss user SSH keys must be set up between the Resource Manager server and the target. The target must have a zenoss user.
- ZENHOME directory must be present on the remote machine.
- zensocket/pyraw must be present on the remote machine, and the setuid bits must be set.

Tip: The best way to meet the prerequisite conditions is to install the Resource Manager RPM on the remote machine. After installation, **do not start** Resource Manager.

Follow these steps to install a remote hub, using Resource Manager SSH keys for access to the remote host.

Note

For detailed steps for creating SSH keys, see the section titled "Setting Up SSH Keys for Distributed Collector."

1. Select the zenoss SSH keys option.

The screenshot shows a web interface for adding a hub. At the top, there is a blue header with the text "/Monitors". Below this is a white box with a blue header titled "Add Hub". Inside this box, there are three radio button options: "root password", "root SSH keys", and "zenoss SSH keys". The "zenoss SSH keys" option is selected. Below the options is a light blue box containing the following text: "Install an additional Hub on a remote host using preexisting zenoss SSH key for the remote host. This option requires a preexisting Zenoss install on the remote host. Using this option does not require root access to the remote host. Please see Zenoss Extended Monitoring guide for more information". Below this text are five input fields: "Hub ID:" (empty), "Host:" (empty), "Port:" (containing "8790"), "Hub Password:" (containing six dots), and "XML RPC Port:" (containing "8082"). At the bottom left of the form is a button labeled "Add Hub".

Figure 16.10. Install Remote Hub (Resource Manager SSH Keys)

2. Enter or change setup details:
 - **Hub ID** - Enter a name for the new hub. The name can be any unique combination of letters, digits, and dashes.
 - **Host** - Enter the fully qualified domain name, IP address, or resolvable hostname of the server on which the new hub will run.
 - **Port** - Enter the port number on which the hub should listen for collectors. The default port is 8790.

- **Hub Password** - Enter the hub password that the collectors will use to log in to this hub. The default password is "zenoss."
- **XML RPC Port** - Specify the port on which the hub should listen for xml-rpc requests from the collectors or other API clients.

3. Click **Add Hub**.

The system displays log output from the creation of the new hub. When fully configured (this may require several minutes), click the link at the bottom of the page to go to the overview page for the new hub.

16.8.3. Setting Up SSH Keys for Distributed Collector

Follow these instructions to create SSH keys for use when setting up hubs and collectors.

These instructions assume you are using openssh. For more information, refer to the ssh-keygen man pages.

1. Use the following commands to generate an openssh RSA key pair for the zenoss user:

```
mkdir $HOME/.ssh
ssh-keygen -t rsa -f $HOME/.ssh/id_rsa -P "
```

2. Lock down the key pair:

```
chmod 700 $HOME/.ssh
chmod go-rwx $HOME/.ssh/*
```

3. Copy the generated public key `$HOME/.ssh/id_rsa.pub` file to the remote machine. On the remote machine, add the public key to the `authorized_keys` file in the account the user wants to log in to by using the SSH key.

a. If `$HOME/.ssh` does not exist on the target machine, then create it with these commands:

```
mkdir ~/.ssh
chmod 700 ~/.ssh
```

b. Add the key:

```
cat id_rsa.pub >> $HOME/.ssh/authorized_keys
chmod 600 $HOME/.ssh/authorized_keys
```

Note

You cannot use keys with a pass phrase with Resource Manager.

Chapter 17. Domain Name System (DNS)

17.1. About

The DigMonitor and DNSMonitor ZenPacks monitor the availability and response time of a DNS request.

17.2. DigMonitor

The DigMonitor ZenPack uses the `check_dig` Nagios plugin, which uses the `dig` command.

17.2.1. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss Version 2.2 or higher
Required ZenPacks	ZenPacks.zenoss.DigMonitor

Table 17.1. DigMonitor Prerequisites

17.2.2. Enable Monitoring

To enable monitoring by the system:

1. Select Infrastructure from the navigation bar.
2. Click the device name in the device list.

The device overview page appears.

3. Expand Monitoring Templates in the left panel, and then select Device.
4. Select Bind Templates from the Action menu.

The Bind Templates dialog appears.

5. Add the DigMonitor template to the list of selected templates, and then click **OK**.

The DigMonitor template appears under Monitoring Templates.

6. Select the DigMonitor template in the left panel, and change options as needed.

Option	Description
DNS Server	Name server against which the dig command should be run. The default is the device host name.
Port	Port on which the name server is listening. This is normally port 53.
Record Name	Name of the record you want to look up. The default is zenoss.com.
Record Type	DNS record type (for example, A, MX, CNAME).

Table 17.2. DigMonitor Data Source Options

17.3. DNSMonitor

The DNSMonitor ZenPack uses the `check_dns` Nagios plugin, which uses the `nslookup` command.

17.3.1. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss Version 2.2 or higher
Required ZenPacks	ZenPacks.zenoss.DNSMonitor

Table 17.3. DNSMonitor Prerequisites

17.3.2. Enable Monitoring

To enable monitoring by the system:

1. Select Infrastructure from the navigation bar.
2. Click the device name in the device list.

The device overview page appears.

3. Expand Monitoring Templates in the left panel, and then select Device.
4. Select Bind Templates from the Action menu.

The Bind Templates dialog appears.

5. Add the DNSMonitor template to the list of selected templates, and then click **OK**.

The DNSMonitor template appears under Monitoring Templates.

6. Select the DNSMonitor template in the left panel, and change options as needed.

Option	Description
DNS Server	Name server against which the nslookup command should be run. If empty (the default), the default DNS server or servers in <code>/etc/resolve.conf</code> are used.
Port	Port on which the name server is listening. This is normally port 53.
Host Name	Host name to resolve. The default is the device ID.
Expected IP Address	IP address to which the host name is expected to resolve.

Table 17.4. DNSMonitor Data Source Options

17.4. Daemons

Type	Name
Performance Collector	zencommand

Table 17.5. Daemons

Chapter 18. Dynamic Service View

18.1. About

Dynamic Service View ("dynamic view") is a visualization of system objects and their relationships to other objects. You can access the dynamic view from groups, systems, and locations. Depending on the object type, different relationships are illustrated.

Each dynamic view shows related objects in a graph. Each object in that graph displays its associated event information.

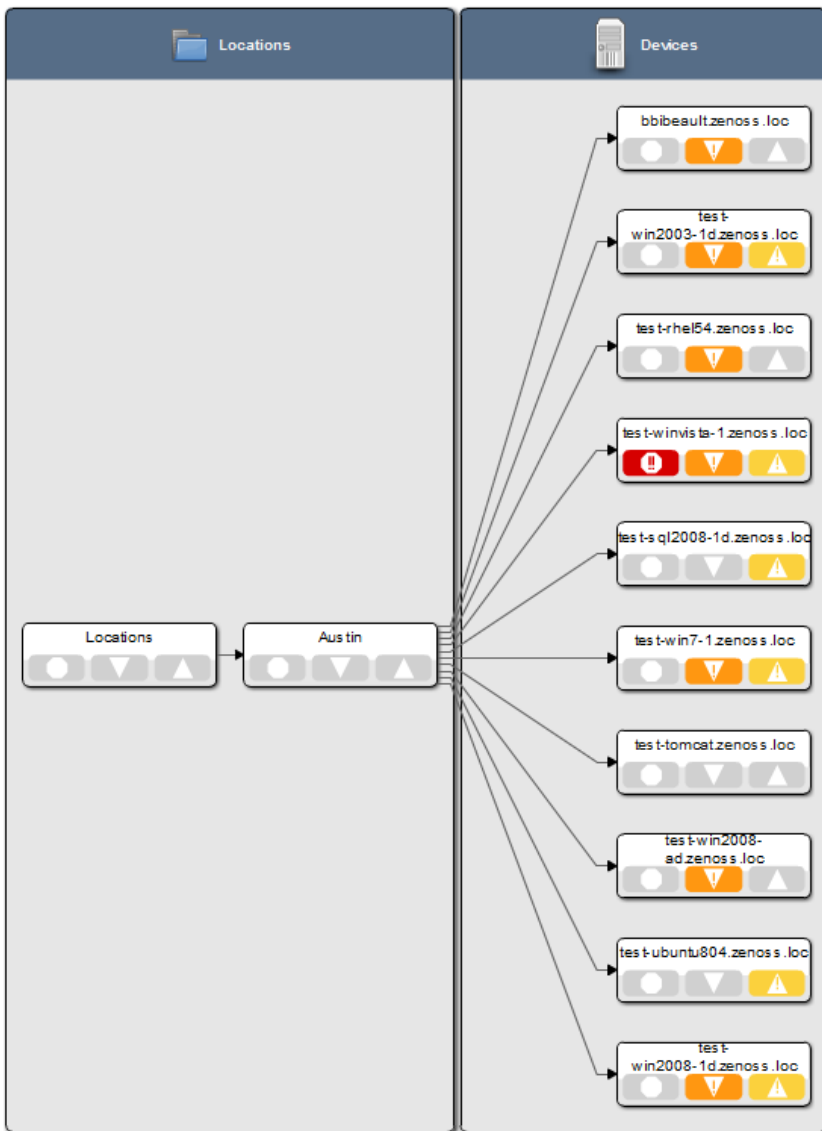

Figure 18.1. Dynamic Service View: Locations Graph

When you click an object in the graph, the "inspector" panel appears. This panel provides detailed information about the object and links directly to it. Information that appears in the inspector depends on the object type selected.

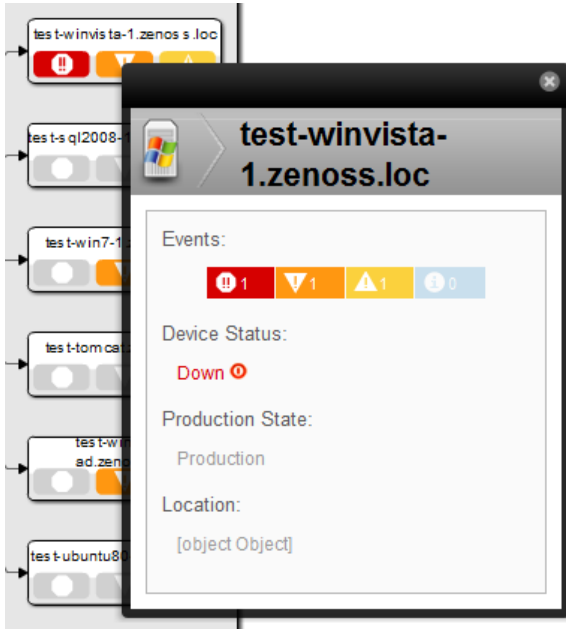

Figure 18.2. Dynamic Service View: Inspector Panel

View controls appear to the right of the graph. These allow you to adjust your view:

- **Overview** - Toggles display on and off of the graph overview illustration.
- **Magnifier** - Toggles on and off the magnifier, which allows you to magnify selected portions of the graph.
- **Zoom In** - Zooms in on the graph.
- **Zoom Out** - Zooms out on the graph.
- **Fit View** - Fits the graph to the browser page.
- **Refresh** - Refreshes the graph.

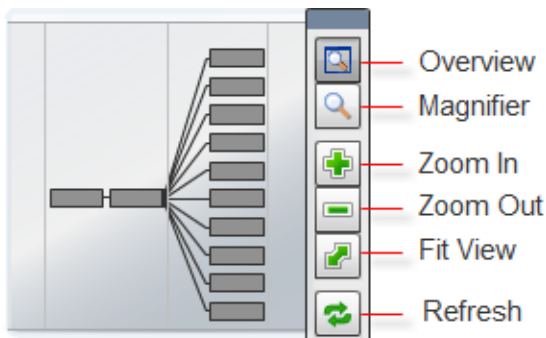

Figure 18.3. Dynamic View: View Controls

18.1.1. Dynamic View of Organizers

The dynamic view of organizers shows objects that can impact the status of the organizer, such as other organizers and devices. This view also shows relationships between devices and a virtual infrastructure, such as VMware or Cisco UCS objects monitored by the system, as well as storage information.

To access the dynamic view for an organizer (such as a group, system, or location):

1. From Infrastructure > Devices, select the organizer in the devices hierarchy.
2. Click **Details**.
3. Select Dynamic Service View.

18.1.2. Dynamic View of Devices

The dynamic view of devices shows the relationship between a device and monitored components.

To access the dynamic view for a device:

1. From Infrastructure > Devices, click a device in the device list.

The device overview page appears.

2. Select Dynamic Service View in the left panel.

18.1.2.1. Dynamic View of Cisco UCS Devices

On Cisco UCS devices, the dynamic view shows the components and relationships that make up a Cisco UCS cluster.

18.1.2.2. Dynamic View of VMware Hosts

On VMware Hosts (ESX servers), the dynamic view shows the relative VMware elements that are connected to the host, such as:

- VMs that currently are running on the Host
- Data stores that are mounted by the Host
- Clusters to which the Host belongs

18.1.2.3. Dynamic View of Storage Devices

On storage devices, such as NetApp Filers, there are two dynamic views:

- **Physical Storage View** - Shows the device's storage enclosures and associated hard disks.
- **Logical Storage View** - Shows the logical storage arrangement that the storage device presents, such as file systems and raid groups.

18.2. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss Version 3.0 or higher
Required ZenPacks	ZenPacks.zenoss.DynamicView
Other	Oracle/Sun JRE 1.5 or later, Flash-enabled Web browser

Table 18.1. Prerequisites

18.3. Enabling

After installing the DynamicView ZenPack, you must restart the system. The `zenjserver` daemon must be running for dynamic views to be visible.

18.4. Daemons

Type	Name
Display	zenjserver

Table 18.2. Daemons

Chapter 19. Enterprise Collector

19.1. About

The Enterprise Collector ZenPack allows collector daemons to start and monitor devices, even if a connection to ZenHub is not available when the daemon starts.

Enterprise Collector enables configuration caching for these collector daemons:

- zenwin
- zeneventlog
- zenwinperf
- zenprocess

Data and events are cached locally and are sent to ZenHub as needed after a connection is re-established. Cached configuration data is stored in `$ZENHOME/perf/Daemons/MonitorName/DaemonName-Suffix`, where *Suffix* is one of:

- configs.db
- properties.pickle
- threshold-classes.pickle
- thresholds.pickle

For example:

```
[zenoss@zenosst zenpacks]$ ls $ZENHOME/perf/Daemons/localhost/zeneventlog*
/opt/zenoss/perf/Daemons/localhost/zeneventlog-configs.db
/opt/zenoss/perf/Daemons/localhost/zeneventlog-properties.pickle
/opt/zenoss/perf/Daemons/localhost/zeneventlog-threshold-classes.pickle
/opt/zenoss/perf/Daemons/localhost/zeneventlog-thresholds.pickle
```

Each time a collector daemon successfully retrieves configuration information from ZenHub, it updates the cached files. This happens at startup, and then every 20 minutes to 6 hours (depending on the daemon and its configuration). A daemon must successfully connect once before it can use the cached files if ZenHub is not available.

The cached files are considered transient, and can be deleted without harm to the system.

19.2. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss Version 2.5 or higher

Table 19.1. Enterprise Collector Prerequisites

19.3. Enabling Enterprise Collector

After installing the Enterprise Collector ZenPack, restart Resource Manager and all Resource Manager daemons (including `zenhub`).

Chapter 20. Enterprise Linux

20.1. About

The EnterpriseLinux ZenPack extends the capabilities of the LinuxMonitor ZenPack and enables Resource Manager to use Secure Shell (SSH) to monitor Linux hosts. Resource Manager models and monitors devices placed in the `/Server/SSH/Linux` device class by running commands and parsing the output. Parsing of command output is performed on the Resource Manager server or on a distributed collector. The account used to monitor the device does not require root access or special privileges for the default modeler plugins.

20.2. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss Version 2.4 or higher
Required ZenPacks	ZenPacks.zenoss.LinuxMonitor, ZenPacks.zenoss.EnterpriseLinux

Table 20.1. Enterprise Linux Prerequisites

Note

If using a distributed collector setup, SSH requires firewall access (default of port 22) from the collector to the monitored server.

20.3. Add a Linux Server

The following procedure assumes that the credentials have been set.

1. From Infrastructure > Devices, Select Add a Single Device from  (Add Device).
2. Enter the following information:

Name	Description
Device Name	Linux host to model
Device Class Path	<code>/Server/SSH/Linux</code>
Discovery Protocol	Set this to <code>auto</code> unless adding a device with username/password different than found in the device class. If you set this to <code>none</code> , then you will need to add the credentials (see Section 20.4, "Set Linux Server Monitoring Credentials") and then manually model the device.

Table 20.2. Adding Linux Device Information

3. Click **Add**.

20.4. Set Linux Server Monitoring Credentials

All Linux servers must have a device entry in an organizer below the `/Devices/Server/SSH/Linux` device class.

Tip

The SSH monitoring feature will attempt to use key-based authentication before using a configuration properties password value.

1. Navigate to the device or device class in the Resource Manager interface.
 - If applying changes to a device class:
 - a. Select the class in the devices hierarchy.
 - b. Click **Details**.
 - c. Select Configuration Properties.
 - If applying changes to a device:
 - a. Click the device in the device list.
 - b. Select Configuration Properties.
2. Verify the credentials for the service account to access the service.

Name	Description
zCommandUsername	Linux user with privileges to gather performance information.
zCommandPassword	Password for the above user.

Table 20.3. Linux Configuration Properties

3. Click Save to save your changes.

20.5. Resolving CHANNEL_OPEN_FAILURE Issues

The **zencommand** daemon's log file (`$ZENHOME/collector/zencommand.log`) may show messages stating:

```
ERROR zen.SshClient CHANNEL_OPEN_FAILURE: Authentication failure
WARNING:zen.SshClient:Open of command failed (error code 1): open failed
```

If the **sshd** daemon's log file on the remote device is examined, it may report that the `MAX_SESSIONS` number of connections has been exceeded and that it is denying the connection request. At least in the OpenSSH daemons, this `MAX_SESSIONS` number is a compile-time option and cannot be reset in a configuration file.

In order to work around this limitation of the **sshd** daemon, use the configuration property `zSshConcurrentSessions` to control the number of connections created by **zencommand** to the remote device.

1. Navigate to the device or device class in the Resource Manager interface.
 - If applying changes to a device class:
 - a. Select the class in the devices hierarchy.
 - b. Click **Details**.
 - c. Select Configuration Properties.
 - If applying changes to a device:
 - a. Click the device in the device list.
 - b. Select Configuration Properties.
2. Apply an appropriate value for the maximum number of sessions.

Name	Description
zSshConcurrentSessions	Maximum number of sessions supported by the remote device's <code>MAX_SESSIONS</code> parameter. A common value for Linux is 10.

Table 20.4. Concurrent SSH Configuration Properties

- Click Save to save your changes.

20.6. Resolving Command timed out Issues

The `zencommand` daemon's log file (`$ZENHOME/collector/zencommand.log`) may show messages stating:

```
WARNING:zen.zencommand:Command timed out on device device_name: command
```

If this occurs, it usually indicates that the remote device has taken too long in order to return results from the commands. In order to increase the amount of time to allow devices to return results, change the configuration property `zCommandCommandTimeout` to a larger value.

- Navigate to the device or device class in the Resource Manager interface.
 - If applying changes to a device class:
 - Select the class in the devices hierarchy.
 - Click **Details**.
 - Select Configuration Properties.
 - If applying changes to a device:
 - Click the device in the device list.
 - Select Configuration Properties.
- Apply an appropriate value for the command timeout.

Name	Description
zCommandCommandTimeout	Time in seconds to wait for commands to complete on the remote device.

Table 20.5. SSH Timeout Configuration Properties

- Click Save to save your changes.

20.7. DMIDECODE Modeler Plugin

This plugin allows you to collect and model detailed hardware and kernel information on your Linux devices.

Since the `dmidecode` command requires root privileges, it needs to be run with something like `sudo`. Sample entries required on the `sudoers` file on each remote device are:

```
Cmnd_Alias DMIDECODE = /usr/sbin/dmidecode
## Allows members of the zenoss group to gather modeling information
Defaults:zenoss !requiretty
%zenoss ALL = (ALL) NOPASSWD: DMIDECODE
```

To use this plugin, add it to the list of collector plugins for the device or device class, and then remodel. For more information on working with Resource Manager plugins, refer to *Resource Manager Administration*.

20.8. Daemons

Type	Name
Modeler	zenmodeler
Performance Collector	zencommand

Table 20.6. Daemons

Chapter 21. Enterprise Reports

21.1. About

The EnterpriseReports ZenPack adds new reports to the standard Resource Manager reports. Available reports include:

- 95th Percentile
- Alert Rule Email Addresses
- Defined Thresholds
- Event Time to Resolution
- Interface Volume
- Maintenance Windows
- Organizer Availability
- User Event Activity
- Users Group Membership

To access Enterprise reports, select Reports from the Navigation bar. Enterprise reports appear in the left panel.

21.1.1. 95th Percentile

The 95th Percentile report provides details about all network interfaces in the system, sorted by highest utilization.

95th percentile is a widely used mathematical calculation that evaluates the regular and sustained utilization of a network connection. The 95th percentile method more closely reflects the needed capacity of the link in question than other methods (such as mean or maximum rate).

This report is useful for network capacity planning and billing for either average or 95th percentile bandwidth utilization.

You can filter this report by device name. Enter a complete or partial name (using * (asterisk) for matching), and then click **Update** to filter the report.

To change the reporting time period, enter Start and End dates (or click **Select** to select dates from a calendar). Click **Update** to refresh the report.

21.1.2. Alert Rule Email Addresses

The Alert Rule Email Addresses report displays all alert rules and the email addresses to which alerts are sent.

This report is useful when reviewing which users receive certain types of system alerts.

21.1.3. Defined Thresholds

The Defined Thresholds report provides details about all thresholds defined in the system. The report links to the target of each threshold. The target can be a device class, individual device, or individual component.

This report is useful for administering the system. You can use it to quickly identify which threshold events can occur within the system, and the severity of those events.

21.1.4. Event Time to Resolution

The Event Time to Resolution report shows, for each user, the total time taken to acknowledge or clear events. Results are organized by event severity.

This report is helpful for tracking response time SLAs in a NOC-type environment.

21.1.5. Interface Volume

The Interface Volume report shows network interface volume. It reports on all network interfaces in the system, sorted by highest utilization. Volume is defined as the total number of bytes transferred during a specific reporting period.

This report is useful for determining billing on total bandwidth consumption.

To change the reporting time period, enter Start and End dates (or click **Select** to select dates from a calendar). Click **Update** to refresh the report.

21.1.6. Maintenance Windows

The Maintenance Windows report shows all defined windows that are active during a selected time period.

To change the reporting time period, enter Start and End dates (or click **Select** to select dates from a calendar). Click **Update** to refresh the report.

21.1.7. Organizer Availability

Provides the availability percentage of all network organizers in the system. This report can be filtered by organizer, event class, component, and date.

You can report on the availability of device classes, locations, systems, or groups within a defined time frame. This report offers two reporting modes:

- **Averaged** - Defines the organizer as available for the average availability time for all devices contained in it.
- **Coalesced** - Defines the organizer as available only if all devices are available during a certain time period.

Two modes of operation: Averaged - defines the organizer as available for the average availability time for all the devices contained within it. Coalesced - defines availability of the organizer as the available only if all devices are available during a certain time period.

21.1.8. User Event Activity

Reports the total number of events acknowledged and cleared, on a per-user basis, during the reporting period.

This report is helpful for tracking operator activity in a NOC-type environment.

21.1.9. Users Group Membership

Shows all users and the groups to which they belong.

21.2. Viewing Enterprise Reports

After installing the EnterpriseReports ZenPack, you can access Enterprise reports. From the Resource Manager interface, select Reports from the navigation bar.

21.3. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss Version 2.2 or higher
Required ZenPacks	ZenPacks.zenoss.EnterpriseReports

Table 21.1. Enterprise Reports Prerequisites

Chapter 22. Enterprise Security

22.1. About

The EnterpriseSecurity ZenPack enhances Resource Manager security by enabling password encryption. Resource Manager stores the passwords it uses to remotely access hosts in a Zope Object Database (ZODB). After enabling this feature, these passwords are encrypted according to the Advanced Encryption Standard (AES), with 256-bit key sizes.

By using the password encryption feature, you can help prevent an attacker from accessing your managed systems if he gains access to a backup copy of your ZODB.

22.2. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss Version 2.5 or higher
Required ZenPacks	EnterpriseSecurity

Table 22.1. Enterprise Security Prerequisites

22.3. Enabling Password Encryption

To enable password encryption, install the ZenPack. No other action is required to enable this feature. After ZenPack installation, password encryption is always enabled.

To test that password encryption is functioning correctly, use `grep` to search the `Data.fs` file for the value of one of the password configuration properties. For example, if you set `zCommandPassword` to a value of `wobet51`, you can check that passwords are encrypted by using this command on the Resource Manager server:

```
strings $ZENHOME/var/Data.fs | grep wobet51
```

If the Enterprise Security ZenPack is installed, this command will not return results.

Chapter 23. File Transfer Protocol (FTP)

23.1. About

The FTPMonitor ZenPack monitors connection response time to an FTP server.

23.2. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss 2.2 or higher
Required ZenPacks	ZenPacks.zenoss.FTPMonitor

Table 23.1. FTP Prerequisites

23.3. Enable Monitoring

To enable monitoring of the device:

1. Select Infrastructure from the navigation bar.
2. Click the device name in the device list.

The device overview page appears.

3. Expand Monitoring Templates in the left panel, and then select Device.
4. Select Bind Templates from the Action menu.

The Bind Templates dialog appears.

5. Select the FTPMonitor template and move it to the list of selected templates.
6. Click **Save**.

The FTPMonitor template appears under Monitoring Templates.

7. Select the FTPMonitor template and change options as needed.

Option	Description
Port	The port to connect to FTP server (default 21)
Send String	Command string to send to the server
Expect String	A string to expect in server response
Mismatch	If the expected string does not match the string returned from the remote server, create an event with one of these states: ok, warn, crit (default: warn)
Quit String	Command to send to the remote server to end the session

Table 23.2. FTPMonitor Basic Data Source Options

23.4. Enable Secure Site Monitoring

To enable secure site monitoring:

1. Select Infrastructure from the navigation bar.

- Click the device name in the devices list.

The device overview page appears.

- Expand Monitoring Templates in the left panel.
- Select the FTPMonitor template and change options as needed.

Option	Description
Port	The port to connect to FTP server (default 21).
Certificate	Minimum days for which a certificate is valid
Use SSL	Use SSL for the connection

Table 23.3. FTPMonitor Secure Data Source Options

23.5. Tuning for Site Responsiveness

- Select Infrastructure from the navigation bar.
- Click the device name in the devices list.

The device overview page appears.

- Expand Monitoring Templates in the left panel.
- Select the FTPMonitor template and change options as needed.

Option	Description
Timeout	Seconds before connection times out (default: 60)
Refuse	If a TCP/IP connection to the remote service is refused (ie no program is listening at that port) send an event with one of these severity states: ok, warn, crit (default: crit)
Max Bytes	Close the connection once more than this number of bytes are received.
Delay	Seconds to wait between sending string and polling for response
Warning response time (seconds)	Response time to result in a warning status.
Critical response time (seconds)	Response time to result in critical status

Table 23.4. FTPMonitor Tunables Data Source Options

23.6. Daemons

Type	Name
Performance Collector	zencommand

Table 23.5. Daemons

Chapter 24. Foundry Device

24.1. About

The FoundryMonitor ZenPack models specific details on Foundry devices, including:

- DRAM
- Serial Number
- Processor
- Product type

This ZenPack monitors memory utilization, as well as CPU utilization averages for 1 minute, 1 second, and 5 seconds.

It also includes all Foundry traps to ensure proper decoding of those traps through `zentrap`.

24.2. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss Version 2.4 or higher
Required ZenPacks	ZenPacks.zenoss.FoundryMonitor

Table 24.1. Foundry Prerequisites

24.3. Configuring Resource Manager

All Foundry devices must exist in the `/Devices/Network/Foundry` device class.

Follow these steps to configure Resource Manager:

1. Navigate to the device or device class in the Resource Manager interface.
 - If applying changes to a device class:
 - a. Select the class in the devices hierarchy.
 - b. Click **Details**.
 - c. Select Configuration Properties.
 - If applying changes to a device:
 - a. Click the device in the device list.
 - b. Select Configuration Properties.
2. Edit the appropriate configuration properties for the device or devices.

Name	Description
<code>zSnmpCommunity</code>	Consult with your network administrators to determine the SNMP community permitted.
<code>zSnmpMonitorIgnore</code>	Set to a value of <code>False</code> .
<code>zSnmpPort</code>	The default port is 161.

Name	Description
zSnmprVer	Set to a value of v2c.

Table 24.2. Foundry Configuration Properties

3. Click **Save** to save your changes. Resource Manager now will begin collecting Foundry device metrics from this device.
4. Navigate to Graphs and you should see some placeholders for performance graphs. After approximately fifteen minutes you should see the graphs start to become populated with information.

24.4. Daemons

Type	Name
Modeler	zenmodeler
Performance Collector	zenperfsnmp
Traps	zentrap

Table 24.3. Daemons

Chapter 25. HP PC Hardware

25.1. About

HPMonitor provides custom modeling of devices running the HP Insight Management Agents. It also contains hardware identification for HP proprietary hardware. The information is collected through the SNMP interface.

The following information is modeled:

- Hardware Model
- Hardware Serial Number
- Operating System
- CPU Information (socket, speed, cache)

25.2. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss 2.2 or higher
Required ZenPacks	ZenPacks.zenoss.HPMonitor
On each remote device	The HP Insight SNMP Management Agent gathers information about the device.

Table 25.1. HP PC Hardware Prerequisites

25.3. Enable Enhanced Modeling

To enable enhanced modeling:

1. Select Infrastructure from the navigation bar.
2. Click the device name in the device list.

The device overview page appears.

3. Select Modeler Plugins from the left panel.
4. Click Add Fields to reveal the list of available plugins.
5. Select the following available plugins and drag them to the plugins list:
 - HPCpuMap
 - HPDeviceMap
6. Remove the following plugins by clicking the 'X' button to the right of the plugin:
 - zenoss.snmp.CPUMap
 - zenoss.snmp.DeviceMap
7. Click **Save**.
8. Remodel the device using the new plugins. To do this, select Model Device from the Action menu.

25.4. Daemons

Type	Name
Modeler	zenmodeler
Performance Collector	zenperfsnmp

Table 25.2. Daemons

Chapter 26. Hewlett Packard UNIX

26.1. About

The HpxMonitor ZenPack enables Resource Manager to use Secure Shell (SSH) to monitor Hewlett Packard UNIX (HP-UX) hosts. The system models and monitors devices placed in the `/Server/SSH/HP-UX` device class by running commands and parsing the output. Parsing of command output is performed on the system server (if using a local collector) or on a distributed collector. The account used to monitor the device requires root access or special privileges to access `/usr/bin/adb`.

The HpxMonitor ZenPack provides:

- File system and process monitoring
- Network interfaces and route modeling
- CPU utilization information
- Hardware information (memory, number of CPUs, and model numbers)
- OS information (OS-level, command-style information)
- Software package information (such as installed software)

26.2. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss 2.5 or higher
Required ZenPacks	ZenPacks.zenoss.HpxMonitor
Supported HP-UX Releases	HP-UX 11.00

Table 26.1. HP-UX Prerequisites

Note

If using a distributed collector setup, SSH requires firewall access (by default, port 22) from the collector to the monitored server.

26.3. Limitations

This ZenPack has not been tested on Itanium systems.

26.4. Add an HP-UX Device for Monitoring

These steps assume that credentials have been set.

1. From Infrastructure > Devices, select Add a Single Device from  (Add Device).
2. Enter the following information:

Name	Description
Name or IP	HP-UX host to model

Name	Description
Device Class	/Server/SSH/HP-UX
Model Device	Select this option unless adding a device with a user name and password different than found in the device class. If you de-select this option, then you must add the credentials (see Section 26.5, "Set HP-UX Server Monitoring Credentials"), and then manually model the device.

Table 26.2. Adding HP-UX Device Information

3. Click **Add Device** to add the device.

26.5. Set HP-UX Server Monitoring Credentials

All HP-UX servers must have a device entry in an organizer below the /Devices/Server/SSH/HP-UX device class.

Note

The SSH monitoring feature will attempt to use key-based authentication before using a configuration properties password value.

26.5.1. Set Credentials for the Device

1. In the Web interface, navigate to the device.
2. In the left panel, select Configuration Properties.
3. Verify the credentials for the service account to access the service:

Name	Description
zCommandUsername	HP-UX user with privileges to gather performance information
zCommandPassword	Password for the HP-UX user

Table 26.3. HP-UX Configuration Properties

4. Click **Save** to save your changes.

26.5.2. Set Credentials for the Device Class

1. In the Web interface, navigate to the Devices/Server/SSH/HP-UX device class.
2. In the left panel, select Configuration Properties.
3. Verify the credentials for the service account to access the service. (Refer to the previous table titled "HP-UX Configuration Properties.")
4. Click **Save** to save your changes.

26.6. Resolving CHANNEL_OPEN_FAILURE Issues

The **zencommand** daemon's log file (`$ZENHOME/collector/zencommand.log`) may show messages stating:

```
ERROR zen.SshClient CHANNEL_OPEN_FAILURE: Authentication failure
WARNING:zen.SshClient:Open of command failed (error code 1): open failed
```

If you view the **sshd** daemon's log file on the remote device, you may see that the `MAX_SESSIONS` number of connections has been exceeded and that it is denying the connection request. In the OpenSSH daemons, this `MAX_SESSIONS` number is a compile-time option and cannot be reset in a configuration file.

To work around this **sshd** daemon limitation, use the configuration property `zSshConcurrentSessions` to control the number of connections created by **zencommand** to the remote device:

1. Navigate to the device or device class in the Resource Manager interface.
 - If applying changes to a device class:
 - a. Select the class in the devices hierarchy.
 - b. Click **Details**.
 - c. Select Configuration Properties.
 - If applying changes to a device:
 - a. Click the device in the device list.
 - b. Select Configuration Properties.
2. Apply an appropriate value for the maximum number of sessions.

Name	Description
<code>zSshConcurrentSessions</code>	Maximum number of sessions supported by the remote device's <code>MAX_SESSIONS</code> parameter. Common values for HP-UX are 2 and 10.

Table 26.4. Concurrent SSH Configuration Properties

3. Click **Save** to save your changes.

26.7. Resolving Command time out Issues

The **zencommand** daemon's log file (`$ZENHOME/collector/zencommand.log`) may show messages stating:

```
WARNING: zen.zencommand:Command timed out on device device_name: command
```

If this occurs, it generally indicates that the remote device has taken too long to return results from the commands. To increase the amount of time to allow devices to return results, change the configuration property `zCommandCommandTimeout` to a larger value:

1. Navigate to the device or device class in the Resource Manager interface.
 - If applying changes to a device class:
 - a. Select the class in the devices hierarchy.
 - b. Click **Details**.
 - c. Select Configuration Properties.
 - If applying changes to a device:
 - a. Click the device in the device list.
 - b. Select Configuration Properties.
2. Apply an appropriate value for the command timeout.

Name	Description
<code>zCommandCommandTimeout</code>	Time in seconds to wait for commands to complete on the remote device.

Table 26.5. SSH Timeout Configuration Properties

3. Click **Save** to save your changes.

26.8. Daemons

Type	Name
Modeler	zenmodeler
Performance Collector	zencommand

Chapter 27. Internet Relay Chat (IRC)

27.1. About

ZenPacks.zenoss.IrcdMonitor monitors the number of users connected to an IRC server.

27.2. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss 2.2 or higher
Required ZenPacks	ZenPacks.zenoss.IrcdMonitor

Table 27.1. IRC Prerequisites

27.3. Enable Monitoring

To enable monitoring:

1. Select Infrastructure from the navigation bar.
2. Click the device name in the device list.

The device overview page appears.

3. Expand Monitoring Templates in the left panel, and then select Device.
4. Select Bind Templates from the Action menu.

The Bind Templates dialog appears.

5. Move the IrcdeMonitor template from the Available list and move it to the Selected list.
6. Click **Save**.

The IrcdMonitor template is added.

7. Click the new template in the left panel and change options as needed.

Option	Description
Port	Specifies the port to connect to the IRC server (default 6667).
warning_num	Creates a warning event when this number of users are seen.
critical_num	Creates a critical event when this number of users are seen.

Chapter 28. Jabber Instant Messaging

28.1. About

ZenPacks.zenoss.JabberMonitor monitors the response time of devices running a Jabber server.

28.2. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss Version 2.2 or higher
Required ZenPacks	ZenPacks.zenoss.JabberMonitor

Table 28.1. Jabber Prerequisites

28.3. Enable Monitoring

To enable monitoring:

1. Select Infrastructure from the navigation bar.
2. Click the device in the device list.

The device overview page appears.

3. Expand Monitoring Templates in the left panel, and then select Device.
4. Select Bind Templates from the Action menu.

The Bind Templates dialog appears.

5. Move the Jabber template from the Available list to the Selected list, and then click **Save**.

The Jabber template is added. The system can begin collecting Jabber server metrics from the device.

6. Select the newly added template and change options as needed.

Option	Description
Timeout (seconds)	Seconds before connection times out (default: 60)
Port	The port on which the Jabber server is listening. Typically this is port 5223.
Send String	string to send to the server : default <pre><stream:stream to='\${dev/id}' xmlns:stream='http://etherx.jabber.org/streams'></pre>
Expect String	String to expect in server response. <pre><stream></pre>

Type	Name
Performance Collector	zencommand

Table 28.3. Daemons

Chapter 29. Java 2 Platform Standard Edition (J2E)

29.1. About

ZenJMX is a ZenPack that allows Resource Manager to communicate with remote Java Management Extensions (JMX) agents. The ZenJMX ZenPack defines a data source named `JMX` that allows you to query any single or complex-value attribute, or invoke an MBean operation. It also comes with a built-in template named `Java` that contains MBean information for a few beans built into the JVM.

Note

ZenJMX also includes a built-in template named `ZenJMX`. This template should only be used on the device running the `zenjmx` daemon. To monitor other Java servers use the included `Java` template.

When the `zenjmx` daemon is started it communicates with ZenHub and retrieves a list of devices that possess `JMX` data sources. It also spawns a Java process. ZenJMX asynchronously issues queries for each of those devices to the Java process via XML-RPC. The Java process then collects the data from the Java application and returns the results to ZenJMX. Any collection or configuration errors are sent as events to Resource Manager and will appear in the event console.

Lastly, ZenJMX heartbeats after each collect to ZenHub to let Resource Manager know that ZenJMX is still alive and well.

29.1.1. JMX Background

The JMX technology is used throughout the Java Virtual Machine to provide performance and management information to clients. Using a combination of **JConsole** (Sun Microsystems' JMX client that is shipped with the JDK) and JMX, a system operator can examine the number of threads that are active in the JVM or change the log level. There are numerous other performance metrics that can be gleaned from the JVM, as well as several management interfaces that can be invoked that change the behavior of the JVM.

In Java 5, Sun introduced the Remote API for Java Management Extensions. This enhancement defines an RMI wrapper around a JMX agent and allows for independent client development. ZenJMX accesses remote JMX agents via the "Remote API for Java Management Extensions." It currently does not support local connections (provided via the temporary directory) to JMX Agents.

29.1.2. ZenJMX Capabilities

ZenJMX is a full-featured JMX client that works "out of the box" with JMX agents that have their remote APIs enabled. It supports authenticated and unauthenticated connections, and it can retrieve single-value attributes, complex-value attributes, and the results of invoking an operation. Operations with parameters are also supported so long as the parameters are primitive types (Strings, booleans, numbers), as well as the object version of primitives (such as `java.lang.Integer` and `java.lang.Float`). Multi-value responses from operations (Maps and Lists) are supported, as are primitive responses from operations.

The `JMX` data source installed by ZenJMX allows you to define the connection, authentication, and retrieval information you want to use to retrieve performance information. The IP address is extracted from the parent device, but the port number of the JMX Agent is configurable in each data source. This allows you to operate multiple JMX Agents on a single device and retrieve performance information for each agent separately. This is commonly used on production servers that run multiple applications.

Authentication information is also associated with each JMX data source. This offers the most flexibility for site administrators because they can run some JMX agents in an open, unauthenticated fashion and others in a hardened and authenticated fashion. SSL-wrapped connections are supported by the underlying JMX Remote subsystem built into the JDK, but were not tested in the Zenoss labs. As a result, your success with SSL encrypted access to JMX Agents may vary.

The data source allows you to define the type of performance information you want to achieve: single-value attribute, complex-value attribute, or operation invocation. To specify the type of retrieval, you must specify an attribute name (and one or more data points) or provide operation information.

Any numerical value returned by a JMX agent can be retrieved by Resource Manager and graphed and checked against thresholds. Non-numerical values (Strings and complex types) cannot be retrieved and stored by Resource Manager.

When setting up data points, make sure you understand the semantics of the attribute name and choose the correct Resource Manager data point type. Many JMX Agent implementations use inconsistent nomenclature when describing attributes. In some cases the term "Count" refers to an ever-increasing number (a "Counter" data point type). In other cases the term "Count" refers to a snapshot number (a "Gauge" data point type).

29.1.3. Allowable Parameter Types

The following primitive data types are allowed in JMX calls:

- `java.lang.Integer`
- `java.lang.Long`
- `java.lang.Double`
- `java.lang.Float`
- `java.lang.String`
- `java.lang.Boolean`
- `int`
- `long`
- `double`
- `float`
- `boolean`

29.1.4. Single Value Attribute Calls

This is the most basic usage scenario. If you are interested in retrieving a single value from an MBean in a JMX Agent, and the attribute returns simple numeric data, you fall into the "single value attribute" category. To define a single-value attribute call simply provide the fully qualified name of your MBean and then provide the name of the attribute in the Attribute Name field of the data source. Lastly, you must define a data point.

Some examples of this include the commonly referenced JDK Threading information:

- MBean Name: `java.lang:type=Threading`
- Attribute Name: `ThreadCount`
- Data Points:
 - `ThreadCount` (type: gauge)

Java uses lots of file descriptors during normal operation. The number of open file descriptors the JVM is working with can be measured using the following information:

- MBean Name: java.lang:type=OperatingSystem
- Attribute Name: OpenFileDescriptorCount
- Data Points:
 - OpenFileDescriptorCount (type: gauge)

There are several other single-value attributes that can be retrieved from the JDK. We recommend using **JConsole** to interactively navigate through the MBean hierarchy to determine which MBeans contain useful information to you. See Section 29.5, "Using **JConsole** to Query a JMX Agent" for additional information on how to inspect the MBeans deployed in an JMX Agent.

29.1.5. Complex-Value Attribute Calls

If your MBean attribute defines multiple sub-attributes (via CompositeData or Tabular) that you are interested in capturing, then you fall into the category of a "complex-value attribute" call. The JDK contains a few complex-value attributes you might be interested in capturing, including garbage collection statistics that were captured during the copy and mark-sweep compact collection cycles.

To extract data from a complex-value attribute, you must define one or more data points in the data source. The names of the data points are used as keys into the complex-value data structure returned from the MBean attribute. For JMX CompositeData attributes, the data point names are used as a key to map the results. For JMX TabularData, the data point names are used as indexes into the structure to map the result.

The JDK also provides heap memory information via a complex-value attribute. The amount of committed, used, and maximum heap memory can be viewed by setting up a complex-value attribute in Resource Manager with the following information:

- MBean Name: java.lang:type=Memory
- Attribute Name: HeapMemoryUsage
- Data Points:
 - committed (type: gauge)
 - used (type: gauge)
 - max (type: gauge)

29.1.6. Example Method Calls

Some management values need to be computed. These situations frequently arise when custom MBeans are deployed alongside an enterprise application. An MBean named "Accounting" might be deployed within an enterprise application that defines operations intended for operators or support staff. These operations might include methods such as "getBankBalance()" or "countTotalDeposits()".

ZenJMX has the ability to invoke operations, but there are some subtleties in how ZenJMX sends parameters to the JMX Agent and interprets the response.

29.1.6.1. No parameters, single return value

In the most basic usage scenario no arguments are passed to the operation and a single value is returned. This usage scenario is very similar to a single-value attribute call, except we're invoking an operation to retrieve the value rather than accessing an attribute. The configuration for this hypothetical usage scenario follows:

- MBean Name: Application:Name=Accounting,Type=Accounting
- Operation Name: getBankBalance()
- Data Points:

- balance (type: gauge)

29.1.6.2. No parameters, multiple values returned in List format

In this scenario no parameters are passed to an operation, but multiple response values are provided in a List. The values returned are expressed in a List<Object>, but they are coerced (but not casted) to doubles prior to being stored in Resource Manager. This means that returning a numeric value as "1234" will work, but "1,234" will not work. The litmus test is to evaluate if `Double.valueOf(object.toString())` will successfully evaluate.

ZenJMX can be configured to read multiple values from an operation's results by defining multiple data points. You must define a data point for each value returned from the operation, and if there is a mismatch between the number of data points you define and the size of the List<Object> returned an exception will be generated. The configuration for ZenJMX follows:

- MBean Name: Application:Name=Accounting,Type=Accounting
- Operation Name: getBalanceSummary()
- Data Points:
 - dailyBalance (type: gauge)
 - annualBalance (type: gauge)

29.1.6.3. No parameters, multiple values returned in Map format

In this scenario no parameters are passed to an operation, but multiple response values are provided in a Map<String, Object>. The keyset of the Map contains the names of data points that can be defined, and the values are the values of said data points. When a Map<String, Object> is returned you need not capture all of the returned values as data points, and you can instead pick the exact values you are interested in. To choose the values to capture you simply define data points with the same names as Strings in the keyset.

The following configuration demonstrates how to extract specific data points from an operation that returns a Map<String, Object>. The key item to note in this configuration is that "dailyBalance" and "annualBalance" must be present as keys in the returned Map<String, Object> and their values must be coercible via the `Double.valueOf(object.toString())` idiom.

- MBean Name: Application:Name=Accounting,Type=Accounting
- Operation Name: getBalances()
- Data Points:
 - dailyBalance (type: gauge)
 - annualBalance (type: gauge)

29.1.6.4. Single parameter in polymorphic operation

MBeans are implemented as Java classes and Java permits parameterized polymorphic behavior. This means that multiple methods can be defined with the same name so long as their parameter signatures differ. You can safely define "getBalance(String)" and "getBalance()" and the two exist as separate methods.

In order to properly resolve methods with the same name the caller must provide a Class[] that lists the types of parameters that exist in the method's signature. This resolves the candidate methods to an individual method which can then be invoked by passing an Object[].

ZenJMX allows you to resolve methods of the same name and asks you to provide the fully qualified class names of each parameter in comma delimited format when you set up the data source. Note that primitive types (String, Boolean, Integer, Float) are supported but complex types are not supported, and that you must include the class' package name when providing the information (java.lang.String).

The Object[] of parameter values must line up with Class[] of parameter types, and if there is a mismatch in the number of types and values that are provided an exception will be generated.

The marshaling of values from String to Boolean, Integer, and Float types is provided via the .valueOf() static method on each of those types. That is, if you define an attribute of type java.lang.Integer you must provide a String that can be successfully passed to java.lang.Integer.fromValue(). If you fail to do so an exception is generated.

This example illustrates how to pass a single parameter to a polymorphic operation:

- MBean Name: Application:Name=Accounting,Type=Accounting
- Operation Name: getBalances()
- Parameter Types: java.lang.Integer
- Parameter Values: 1234
- Data Points:
 - balance (type: gauge)

Here is another example where we've changed the type of the parameter passed to the method to be a String. Semantically it represents a different type of Account in our example:

- MBean Name: Application:Name=Accounting,Type=Accounting
- Operation Name: getBalances()
- Parameter Types: java.lang.String
- Parameter Values: sbb552349999
- Data Points:
 - balance (type: gauge)

29.1.6.5. Multiple parameters in polymorphic operations

The above example describes how polymorphic behavior in Java functions and how method resolution can be provided by identifying the Class[] that represents the parameters passed to a method. The situation where multiple parameters are passed to a polymorphic operation is no different then the situation where a single parameter is passed to a polymorphic operation, except that the length of the Class[] and Object[] is greater than one.

When multiple parameters are required to invoke an operation you must provide the fully qualified class names of each parameter's type in comma delimited format, as well as the object values for each type (also in comma delimited format).

The following example demonstrates a configuration that passes two parameters to an MBean operation. The second parameter passed is a default value to return if no account can be located matching the first parameter.

- MBean Name: Application:Name=Accounting,Type=Accounting
- Operation Name: getBalances()
- Parameter Types: java.lang.String, java.lang.Integer
- Parameter Values: sbb552349999, 0
- Data Points:
 - balance (type: gauge)

There are additional combinations that are possible with polymorphic methods and the values they return, and those combinations are left as an exercise for the reader to explore. The logic for extracting results from multi-value operation invocations follows the same rules as the logic for extracting results from a multi-value attribute read. For additional information on the rules of that logic see the section above on multi-value attributes.

29.2. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss Version 2.2 or higher
Required ZenPacks	ZenPacks.zenoss.ZenJMX
Other	Sun JRE Version 5.0 or higher

Table 29.1. J2EE Prerequisites

29.2.1. Sun Java Runtime Environment (JRE)

ZenJMX requires Sun JRE Version 5.0 or higher. Make sure that after you install Sun's JRE you update your PATH such that the **java** executable works. You can test this using the command:

```
$ which java
/usr/java/default/bin/java
```

If the above returns a fully qualified path, then you have successfully installed Java.

If Java is not installed, the **which** will return a message similar to the following:

```
$ which java
/usr/bin/which: no java in (/usr/local/bin:/bin:/usr/bin:/opt/zenoss/bin)
```

To determine which version of Java is installed, run the following command:

```
$ java -version
java version "1.5.0_16"
Java(TM) 2 Runtime Environment, Standard Edition (build 1.5.0_16-b06-284)
Java HotSpot(TM) Client VM (build 1.5.0_16-133, mixed mode, sharing)
```

Warning

Sun's Java version 5 (aka 1.5) **must** be installed. The GNU Java does not work.

Note

ZenJMX and Sun's JRE is installed using a **conary** command. As root, run the following command:

```
conary update --resolve group-zenjmx
```

29.3. Example to Monitor a JMX Value

29.3.1. Enabling Remote JMX Access

Each application server has a slightly different process for enabling remote JMX Access. It's best to consult with your application server for specific instructions. We've included instructions for a few commonly used configurations below.

JMX agents can be configured in two ways: remote access and local-only. When configured for remote access a JMX client communicates with the JMX agent via a socket and uses the Remote Method Invocation (RMI) protocol to access the MBeans. When configured for local-only access the JMX agent periodically dumps serialized MBeans to a temporary directory on the machine. **JConsole** can be used to access JMX agents in local-only mode as well as in remote mode (via RMI). ZenJMX can only be used with remote servers via RMI and cannot work with local-only serialized MBeans. This is not a significant limitation because ZenJMX can establish RMI connections to localhost just as easily as it can establish RMI connections to remote hosts.

The `JAVA_OPTS` environment variable can be used to enable remote access to JVM MBeans. Set it as follows:

```
JAVA_OPTS="-Dcom.sun.management.jmxremote.port=12345
JAVA_OPTS="${JAVA_OPTS} -Dcom.sun.management.jmxremote.authenticate=false"
JAVA_OPTS="${JAVA_OPTS} -Dcom.sun.management.jmxremote.ssl=false"
export JAVA_OPTS
```

When starting an application pass the `JAVA_OPTS` variable as an argument to the JVM as follows:

```
java ${JAVA_OPTS} -classpath /path/to/application.jar com.yourcompany.Main
```

You can then use **JConsole** to connect to `localhost:12345`. Authentication can be configured by modifying the `java.security` file as well as `java.policy`. There are lots of examples available on the Internet that can provide guidance in how to achieve authenticated remote access to JVM MBeans.

29.3.2. Configure Resource Manager with a Custom Data Source

Custom JMX data sources allow system administrators to monitor any attribute or operation result accessible via a JMX call. ZenJMX creates a JMX data source and allows you to provide object information, as well as authentication settings, and attribute/operation information. Determining which object and attribute names, as well as which operations to invoke, is the key to customizing ZenJMX.

To configure the system with a custom data source:

1. Select Infrastructure from the navigation bar.
2. Click the device in the device list.

The device overview page appears.

3. Expand Monitoring Templates in the left panel, and then select Device.
4. Select Add Local Template from the Action menu.

The Add Local Template dialog appears.

5. Enter a name for the template (such as JVM Values), and then click **Submit**.

The template is added.

6. Select the newly created template.

7. Click  (Add) in the Data Sources area.

The Add Data Source dialog appears.

8. Enter a name for the data source (Heap Memory), select JMX as the type, and then click Submit.

The data source is added.

9. Double-click the data source to edit it. Change options as needed, and then click **Save**.

Option	Description
JMX Management Port	This is not necessarily the same as the listen port for your server.
Object Name	The Object Name is also referred to as the MBean name. Enter <code>java.lang:type=Memory</code>
Attribute Name	Enter <code>HeapMemoryUsage</code>

Table 29.2. Memory Head Example ZenJMX Data Source Options

10. Add data points named `committed`, `max`, and `used`:

- a. Select Add Data Point from the Action menu.

The Add Data Point dialog appears.

- b. Enter the name of the data point (`committed`, `max`, or `used`) and then click **Submit**.

11. After adding all data points, add graphs that reference them. (For more information, see *Resource Manager Administration*.)

Review Section 29.5, “Using **JConsole** to Query a JMX Agent” to learn how to determine the object name, attribute name, and data points that might be interesting in your application.

29.4. Monitor Values in `TabularData` and `CompositeData` Objects

The Attribute Path input value on the ZenJMX data source allows you to monitor values nested in the `TabularData` and `CompositeData` complex open data objects. Using this value you can specify a path to traverse and index into these complex data structures.

If the result of traversing and extracting a value out of the nested open data is a single numeric value then it is automatically mapped to the datapoint in the data source. However, if the value from the open data is another open data object then the data point names from the datasource are used as indexes or keys to map values out of the open data.

The input value is a dot-separated string that represents a path through the object. Non-bracketed values are keys into `CompositeData`. Bracketed values are indexes into `TabularData`.

For `TabularData` indexes with more than one value, use a comma-separated list with no spaces (for example, `[key1,key2]`).

To specify a column name (needed only when the table has more than two columns) use curly brackets after the table index.

Example

To get the used Tenured Generation memory after the last garbage collection from the Garbage Collector MBean, set the Attribute Name on the datasource to `lastGcInfo`. Set the Attribute Path to:

```
memoryUsageAfterGc.[Tenured Gen].{value}.used
```

The key `memoryUsageAfterGc` is evaluated against the `CompositeData` returned from the `lastGcInfo` attribute. The evaluation results in a `TabularData` object. Then, the `[Tenured Gen]` index is evaluated against the `TableData`, which returns a row in the table.

Since a row in the table can contain multiple columns, the key `value` (in curly brackets) is used to pick a column in the row. Lastly, the key `used` is evaluated against the `CompositeData` in the column to return the memory value.

In this example, since the index being used for the tabular data is not a multi-value index and so the column name is optional. The Attribute Path can be written as:

```
memoryUsageAfterGc.[Tenured Gen].used
```

29.5. Using **JConsole** to Query a JMX Agent

JConsole is a tool built into the JDK that allows system administrators to query a JMX Agent and examine the MBeans deployed within the server. **JConsole** also allows administrators to view JVM summary information, includ-

ing the amount of time the JVM has been running, how many threads are active, how much memory is currently used by the heap, how many classes are currently loaded, and how much physical memory exists on the machine.

JConsole also provides a graph that shows memory, thread, and class usage over time. The scale of the graph can be adjusted so that a system administrator can examine a specific period of time, or can zoom out to view a longer range picture of usage. Unfortunately, **JConsole** can only produce graphs that show usage while **JConsole** was running. Administrators cannot look back in time to a point where the JVM was running but **JConsole** was not monitoring the JVM.

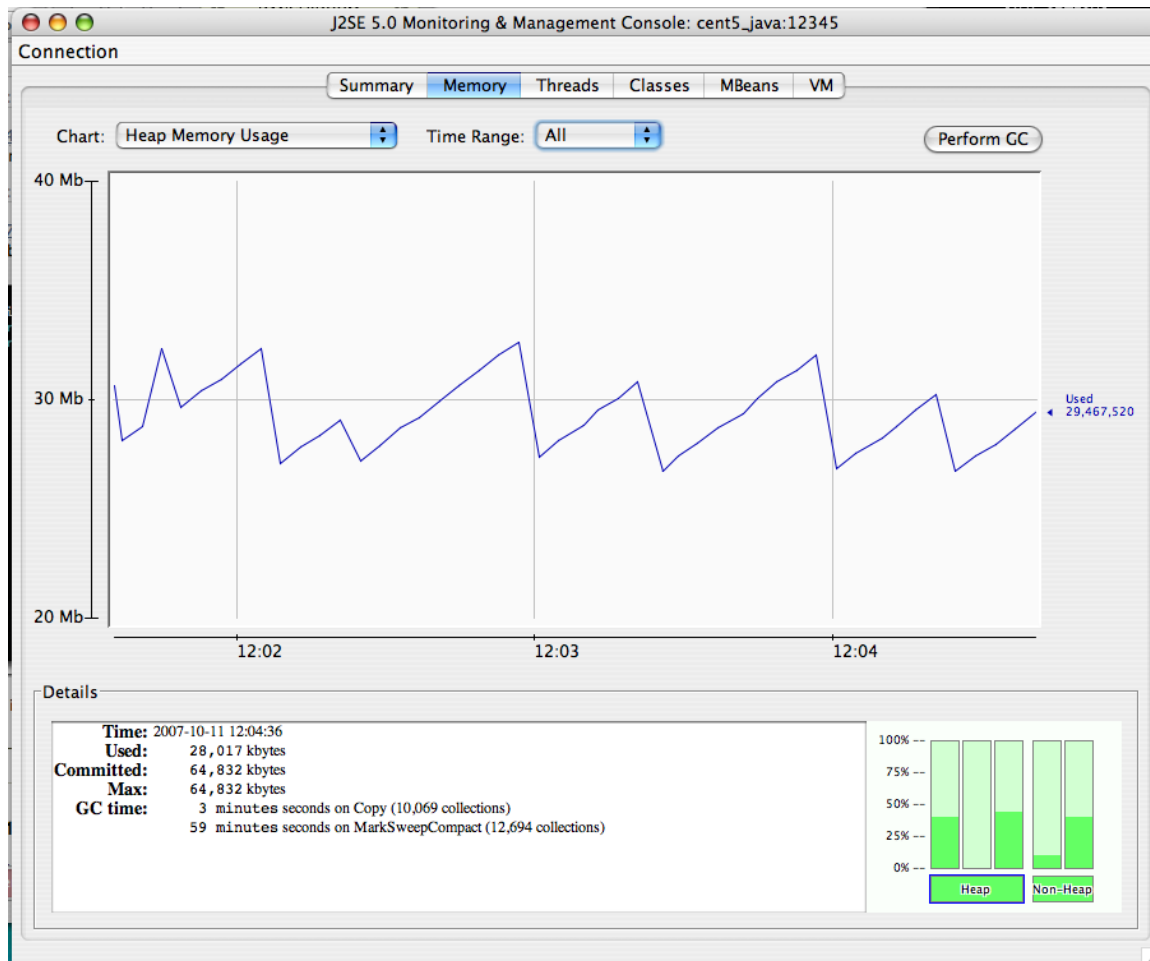

Figure 29.1. JMX Heap Graph

The MBeans tab along the top of **JConsole** provides an interactive method for examining MBean values. After clicking on the MBeans tab a panel will be displayed with a tree on the left hand side. The tree contains a hierarchical list of all MBeans deployed in the JVM.

The standard JVM MBeans are all in the `java.lang` and `java.util.logging` packages. Application server specific MBeans do not follow any standard naming pattern. Some vendors choose to use package names for their MBean names while other vendors choose package-like names (but not fully qualified packages).

To get started expand the `java.lang` node in the Tree. This will expose several MBeans as well as additional folders. Click on the Memory MBean and observe how the right hand side of the panel is populated with information about the Memory MBean.

Figure 29.2. Memory MBean

MBeans can contain attributes and operations. MBeans can also fire notifications to observers, but that's beyond the scope of this document. The attributes tab lists all of the attributes in the first column and their values (or a clickable attribute type) in the second column. In the case of Memory the HeapMemoryUsage is a Composite attribute, otherwise referred to as a "complex-value attribute" in Resource Manager. Double click the "javax.management.openmbean.CompositeDataSupport" type and you will see multiple attributes appear. They show the amount of committed, maximum, and used memory sizes for the heap.

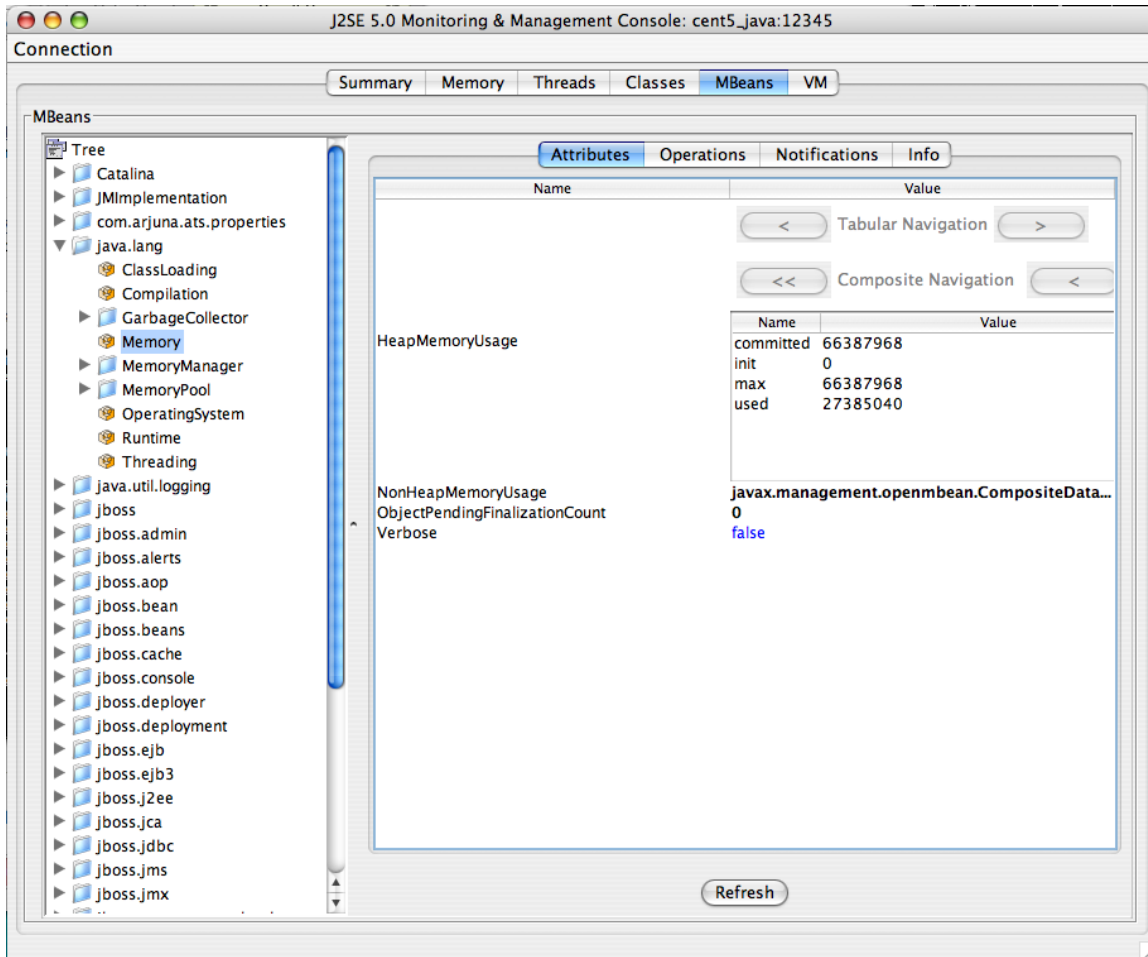

Figure 29.3. Memory MBean Expanded

The unique name of the MBean can be viewed by clicking on the Info tab. The first value is MBean Name. Its value in the case of Memory is: "java.lang:type=Memory."

Note

There is no standardized way to name MBeans; application server vendors name them differently.

You can also examine operation information by clicking on the Operations tab. These are methods that **JConsole** can remotely invoke on an MBean that will result in some value being computed or some state changing in the application. The Threading MBean has several operations that can be invoked that return information. Click on the java.lang package and then click on the Threading operation. Lastly, click on the Operations tab. Methods like "getThreadUserTime" are invocable.

Figure 29.4. Operations Tab

Test the "getThreadUserTime" method by changing the p0 parameter to 1 and clicking the "getThreadUserTime" button. A dialog window will be raised that displays the amount of CPU user time thread #1 has used. Try adjusting the parameter to different values to observe the different CPU times for the threads.

29.6. Daemons

Type	Name
Performance Collector	zenjmx

Table 29.3. Daemons

Chapter 30. JBoss Application Server

30.1. About

the JBossMonitor ZenPack that system administrators to monitor JBoss Application Servers. JBossMonitor uses the JMX Remote API and accesses MBeans deployed within JBoss that contain performance information about the components that are being managed.

The collected performance information includes: pool sizes for data sources (JDBC), Enterprise Java Beans (EJBs), message queues (JMS), threads, servlets, JSPs, and classloaders. Cache information is also accessible, providing system administrators insight into the number of hits (or misses) their cache policy has produced.

The ZenPack also aggregates individual performance metrics into higher level concepts that provide a picture of the performance of the application. Cache hits and misses are combined on the same graph to provide an overall picture of cache performance. Likewise, queue metrics are combined to show the number of messages currently on the queue, being processed, and being placed on the queue. Queue subscribers and publishers are also graphed.

Each of the individual performance metrics can be trended and predicted, and thresholds can be explicitly defined. Both the predicted thresholds and explicit thresholds inform system administrators of potential future problems before they occur. Since so much of J2EE involves "managed resources", the ability to monitor pool sizes and alert administrators prior to resources being exhausted is extremely valuable and can reduce the likelihood of a fatal outage caused by resource depletion.

Most of the metrics that are collected in JBossMonitor represent combinations of individual component metrics. For example, the Thread Pool metric represents all threads in all pools. It is possible to configure JBossMonitor to perform at higher granularity and have it monitor a Thread Pool with a particular name. However, since these names are application specific we have chosen to configure JBossMonitor to collect at a rather coarse-grained level by default. The installer is highly encouraged to customize and configure!

One particular monitoring template that requires end-user configuration involves Servlets. If a site to be monitored is revenue generating, and credit card submissions from the website are handled via a back-end servlet, it may be critically important to monitor the resources made available by the JBoss container to the servlet container. If the number of free spaces in the servlet pool dwindles to zero it could prevent your application from making a sale.

The following are the collected metrics for JBoss servers:

- Active Threads
- JMS Message cache memory usage
- JMS Message hits/misses
- JMS Topic/Destination queue size
- Java heap memory usage
- JCA commit, rollback, and transaction count
- JCA Connection pool in-use connections and available connections
- JCA connections created/destroyed
- JCA total connections
- JGroups cluster messages sent/received
- JGroups cluster bytes sent/received
- MBean creation/removal count
- MBean messages processed count

30.2. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss Version 2.2 or higher
Required ZenPacks	ZenPacks.zenoss.ZenJMX, ZenPacks.zenoss.JBossMonitor

Table 30.1. JBoss Prerequisites

30.3. Enable Monitoring

30.3.1. Configuring JBoss to Allow JMX Queries

JBoss uses the `JAVA_OPTS` approach for enabling remote access to MBeans. However, it requires some additional properties. To set up your `JAVA_OPTS` for use in JBoss see the following code segment:

```
JAVA_OPTS="-Dcom.sun.management.jmxremote.port=12345"
JAVA_OPTS="${JAVA_OPTS} -Dcom.sun.management.jmxremote.authenticate=false"
JAVA_OPTS="${JAVA_OPTS} -Dcom.sun.management.jmxremote.ssl=false"
JAVA_OPTS="${JAVA_OPTS} -Djboss.platform.mbeanserver"
JAVA_OPTS="${JAVA_OPTS} -Djavax.management.builder.initial=org.jboss.system\
.server.jmx.MBeanServerBuilderImpl"
export JAVA_OPTS
```

When you start JBoss via the `run.sh` you must also pass the `"-b 0.0.0.0"` argument:

```
cd ${JBOSS_HOME}/bin
./run.sh -b 0.0.0.0
```

JMX actually uses two separate ports for MBean access: one is used for initial connection handling and authentication, and the other is used for RMI access. During the handshake between a JMX Client and the JMX Agent the agent tells the client the IP address and port number for the RMI registry. By default JBoss sets the IP address to 127.0.0.1. This works when the JMX client and the JMX agent reside on the same device, but it won't work in a distributed environment.

By passing the `"-b 0.0.0.0"` argument you instruct JBoss to bind to all available network ports, and this results in the JMX Agent's handshaking logic using a network reachable address when informing clients of the RMI registry hostname and port.

The `jmx-console` Web page in JBoss allows you to view the different MBeans that are available; however, this does not mean that these MBeans are available remotely. If **JConsole** can view MBeans, then so can the **zenjmx** daemon that gathers this information.

30.3.2. Configuring Resource Manager

All JBoss services must have a device entry under the `/Devices/Server/JBoss` device class.

Note

The **zenjmx** daemon must be configured and running. See Section 29.2.1, "Sun Java Runtime Environment (JRE)" for more information about configuring the **zenjmx** daemon with the Sun JRE tools.

1. Navigate to the device or device class in the Resource Manager interface.
 - If applying changes to a device class:

- a. Select the class in the devices hierarchy.
- b. Click **Details**.
- c. Select Configuration Properties.
- If applying changes to a device:
 - a. Click the device in the device list.
 - b. Select Configuration Properties.
2. Edit the appropriate configuration properties for the device or devices.

Name	Description
zJBossJmxManagementAuthenticate	This configuration property is deprecated.
zJBossJmxManagementPassword	JMX password
zJBossJmxManagementPort	The port number used to gather JMX information
zJBossJmxManagementUsername	JMX username for authentication

Table 30.2. JBoss Configuration Properties

3. Click Save to save your changes.

You will now be able to start collecting the JBoss server metrics from this device.

4. Navigate to Graphs and you should see some placeholders for graphs. After approximately fifteen minutes you should see the graphs start to become populated with information.

Tip

The out-of-the-box JBoss data source configuration has been defined at the macro level, but can be configured to operate on a more granular basis. For example, the Servlet Reload Count applies to all servlets in all Web applications but it could be narrowed to be Servlet /submitOrder in Web application "production server."

30.4. Change the Amount of Data Collected and Graphed

1. Navigate to the device or device class under the `/Devices/Server/JBoss` device class in the interface.
2. In the left panel, select Monitoring Templates
3. Select Bind Templates from the Action menu.
4. To add other templates and retain existing monitoring templates, hold down the control key while clicking on the original entries.

Name	Description
JBoss Core	Core information about any JBoss server, including memory usage, threads, and uptime.
JBoss JCA Connection Pool	
JBoss JGroups Channel	
JBoss JMS Cache	
JBoss JMS Destination	
JBoss JMS Topic	
JBoss Message Driven EJB	

Table 30.3. JBoss Templates

5. Click the OK button to save your changes.

30.5. Viewing Raw Data

See the Section 29.5, “Using **JConsole** to Query a JMX Agent” section for more information about how to investigate raw data returned from the application.

30.6. Daemons

Type	Name
Performance Collector	zenjmx

Table 30.4. Daemons

Chapter 31. Juniper Devices

31.1. About

The JuniperMonitor ZenPack allows system administrators to monitor their Juniper devices.

31.2. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss 2.2 or higher
Required ZenPacks	ZenPacks.zenoss.JuniperMonitor

Table 31.1. Juniper Prerequisites

31.3. Enable Monitoring

31.3.1. Configuring Juniper Devices to Allow SNMP Queries

Configure the Juniper device to allow SNMP queries from the Resource Manager server, and send SNMP v1 or SNMP v2 traps to the Resource Manager server.

31.3.2. Configuring Resource Manager

All Juniper devices must exist under the `/Devices/Network/Juniper` device class.

1. Navigate to the device or device class in the Resource Manager interface.
 - If applying changes to a device class:
 - a. Select the class in the devices hierarchy.
 - b. Click **Details**.
 - c. Select Configuration Properties.
 - If applying changes to a device:
 - a. Click the device in the device list.
 - b. Select Configuration Properties.
2. Edit the appropriate configuration properties for the device or devices.

Name	Description
zSnmpCommunity	Consult with your network administrators to determine the SNMP community permitted.
zSnmpMonitorIgnore	This should be set to <code>False</code>
zSnmpPort	The default port is 161.
zSnmpVer	This should be set to <code>v2c</code>

Table 31.2. Juniper Configuration Properties

3. Click Save to save your changes. You will now be able to start collecting the Juniper device metrics from this device.

4. Navigate to Graphs and you should see some placeholders for graphs. After approximately fifteen minutes you should see the graphs start to become populated with information.

31.4. Daemons

Type	Name
Modeler	zenmodeler
Performance Collector	zenperfsnmp

Table 31.3. Daemons

Chapter 32. LDAP Authentication

32.1. About

The LDAPAuthenticator ZenPack allows Resource Manager to use your existing LDAP authentication infrastructure (such as Active Directory or OpenLDAP) to enable single sign-on to the Resource Manager Web interface. For example, you can reuse the user management tools with which you are familiar to enable your Windows users to use their Windows credentials to authenticate to the Resource Manager interface. This saves you from having to manually create user accounts and separately maintain passwords.

The benefits of using a service like LDAP to maintain user accounts and privileges include:

- Does not require users to remember yet another password. This decreases support and maintenance requirements.
- Allows centralized management of each user's privileges. This enables easier security auditing and SOX reporting.

Authentication logging is stored in the `$ZENHOME/log/event.log` file.

32.2. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss 2.2 or higher
Required ZenPacks	ZenPacks.zenoss.LDAPAuthenticator

Table 32.1. LDAP Authentication Prerequisites

32.2.1. LDAP Configuration Information

Before configuring LDAP authentication, you must gather the following information from your LDAP or Active Directory administrator. Here is a list of the required information:

- Hostname or IP address of an Active Directory global catalog server. (Active Directory authentication only)
- Hostname or IP address of an LDAP server. (other LDAP server authentication only)
- User's base Distinguished Name (DN). For example, if your domain was `ad.zenoss.com`, then your user's base DN might be:

```
cn=users,dc=ad,dc=zenoss,dc=com
```

- Manager DN. This is the DN (distinguished name) of a user in the domain administrators group. An example that follows the user's base DN is:

```
cn=Administrator,cn=users,dc=ad,dc=zenoss,dc=com
```

- Optional: Active Directory groups to map to Resource Manager roles. You can choose to control user roles within the Resource Manager Web interface using Active Directory groups instead of controlling the roles directly from within Resource Manager. If you do choose to do this you should create the following groups within Active Directory.
 - Resource Manager Managers
 - Resource Manager Users

Note

Zenoss recommends that you make sure that your LDAP server requires at least four successive failures to lock an account. Due to authentication design, each login to Resource Manager goes through three different Web pages. Each one of these pages requests a user authentication, which ends up making a single call to the LDAP backend. Thus, if the user makes one mistake and the LDAP server locks the account on three successive failures, the user's account will be locked even though he specified the password once.

32.3. Limitations

You cannot use LDAP SSL on CentOS4 or the Zenoss Appliance.

32.4. Authenticating with Microsoft Active Directory

32.4.1. Adding the Authentication Plugin

To add the plugin, you must access the ZMI (Zope Management Interface). This allows raw access to the Zope application server and its configured objects. These steps show how to add the ActiveDirectory Multi Plugin with its default settings.

1. Browse to this URL:

`http://YourResource ManagerInstallation:8080/zport/acl_users/manage`

2. Choose the ActiveDirectory Multi Plugin plugin, and then click Add.
3. Complete the form with your credentials and paths:

Name	Description
ID	Enter <code>adPlugin</code> .
Title	Enter a title, or leave blank.
LDAP Server[:port]	Specify the address of the global catalog server from the prerequisites section. It should either be the resolvable hostname or IP address of the global catalog server followed by :3268 Example: <code>ad1.resourcemanager.com:3268</code> If using SSL, the name must be specified.
Read-only	Select this option.
Users Base DN	Use the value obtained from your AD administrator.
Group storage	Groups not stored on LDAP server.
Groups Base DN	Use the value obtained from your AD administrator.
Manager DN	Use the value obtained from your AD administrator.
Password	Use the value obtained from your AD administrator.

Table 32.2. Active Directory Multi Plugin Configuration

4. Click Add to save your changes.

32.4.2. Configuring Plugin Settings

The default plugin settings need some customizations.

1. Browse to this URL:

http://yourResource ManagerInstallation:8080/zport/acl_users/adPlugin/manage

2. Check the following boxes:
 - Authentication
 - Properties
 - User_Enumeration
 - Roles ([Select only if a default role other than Anonymous is desired.])
 - Role_Enumeration ([Select only if a default role other than Anonymous is desired.])
3. Click Update to save your changes.
4. Click Contents tab.
5. Click acl_users folder.
6. Set the following:

Name	Description
User ID Attribute	Windows Login Name (sAMAccountName)
RDN Attribute	Windows Login Name (sAMAccountName)

Table 32.3. Active Directory acl_users Folder Customizations

7. Click Apply Changes to save your changes.
8. Click LDAP Schema tab.
9. In the Add LDAP schema item section, set the following:

Name	Description
LDAP Attribute Name	mail
Friendly Name	Email Address
Multi-valued	No
Map to Name	email

Table 32.4. Active Directory Schema Item Configuration

10. Click Apply Changes to save your changes.
11. Click Add to save your changes.

32.4.3. Enabling Group to Role Mapping

You can optionally control your users' roles within Resource Manager by using the Active Directory groups. If you choose not to do this, you can control their access by setting their roles within the user management section of the Resource Manager Web interface. If you choose to use Active Directory groups, you should use the following steps.

1. Browse to one of the following URLs:
 - For LDAP:

http://yourResource ManagerInstallation:8080/zport/acl_users/manage
 - For Active Directory:

http://yourResource ManagerInstallation:8080/zport/acl_users/adPlugin/manage
2. Put a check in Roles and click Update.

3. Click Properties tab.
4. Change the groupid_attr to: cn.
5. Click Save Changes to save your changes.
6. Click Contents tab.
7. Click acl_users folder.
8. Set the following:

Name	Description
Group storage	Groups stored on LDAP server
Group mapping	Manually map LDAP groups to Zope roles

Table 32.5. Active Directory Group to Role Configuration

9. Click Apply Changes to save your changes.
10. Click Groups tab.
11. Scroll to the bottom of the page and in the Add LDAP group to Zope role mapping section:
 - a. Choose Resource Manager Managers on the left and Manager on the right.
 - b. Click Add.
 - c. Choose Resource Manager Users on the left and ZenUser on the right.
 - d. Click Add.
 - e. Click Apply Changes to save your changes.

32.4.4. Verifying Connectivity and Credentials Outside of Resource Manager

Verify your credential information is valid from the Resource Manager server by using the `ldapsearch` command. To install this command, use the following for RPM-based systems:

```
# yum -y install openldap-clients
```

For the appliance, use the command:

```
# conary update openldap-clients
```

as the zenoss user on the Resource Manager server:

```
ldapsearch -LLL -x -b 'BaseDN' -D 'Bind DN' -W -H ldap://LDAP_server-name \
"sAMAccountName=*" member
```

32.5. Authenticating with other LDAP Servers

1. Browse to this URL:
`http://yourResource ManagerInstallation:8080/zport/acl_users/manage`
2. Choose the LDAP Multi Plugin plugin, and then click Add.
3. Complete the form with your LDAP credentials and paths:

Name	Description
ID	Enter ldapAuthentication.
Title	Enter a title or leave blank.

Name	Description
LDAP Server[:port]	Specify the name or IP address of the LDAP server. The default port is 389, and the default port for SSL is 636, so the port doesn't need to be specified if using the defaults. If using SSL, the name <i>must</i> be specified.
Default User Roles	Set to <code>ZenUser</code> . If this is set as blank, LDAP users will not be able to log in.

Table 32.6. LDAP Multi Plugin Configuration

4. Click Add to save your changes.
5. Click plugins in the list of objects.
6. Click the Authentication Plugins link.
7. Move your `ldapAuthentication` plugin to the list of active plugins, above the `userManager` plugin

32.6. Optimizing Authentication with a Cache

Once you have configured third-party authentication, you should enable caching. Without a cache of LDAP responses, your Resource Manager server must repeatedly query the configured LDAP server or servers for user, group and authentication information. The following steps describe the process of setting up caching of LDAP responses.

1. Log in to Resource Manager as a user with the Manager role.
2. Navigate to `/zport/acl_users/manage` in the Web interface. Do this by replacing the end of your URL within the Resource Manager Web interface.
3. Choose `RAM Cache Manager` from the list of options at top-right.

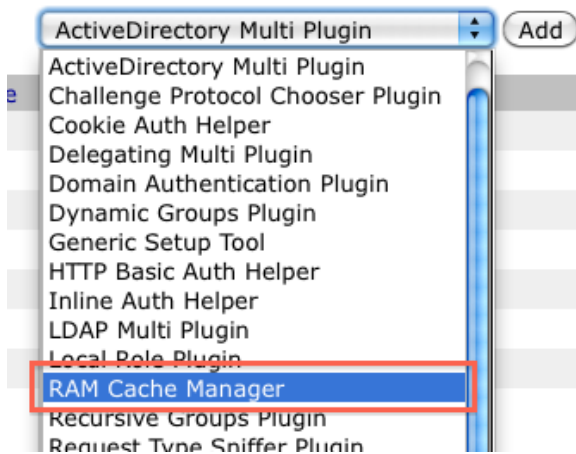

Figure 32.1. Add RAM Cache

4. Set the `Id` to `RAMCache`, and then click Add.
5. Click the new `RAMCache` added to the list to configure it.
 - a. Erase `AUTHENTICATED_USER` from the `REQUEST` variables field.
 - b. Click **Save Changes**.
6. Click `acl_users` in the breadcrumbs to go back to the `acl_users` folder.

► RAM Cache Manager at /zport/**acl_users**/RAMCache

Figure 32.2. *acl_users* Breadcrumbs

7. Click the Cache tab.
8. Select `RAMCache` from the Cache this object using list, and then click Save Changes.
9. Click the Contents tab.
10. Click the `adPlugin` or `ldapAuthentication` plugin, and then click the Cache tab.
11. Select `RAMCache` from the list and click **Save Changes**.

32.7. Configuring Local Authentication as a Fallback

You can use local authentication as a fallback in the event that the LDAP server is unreachable. The local authentication plugin is called `userManager`.

1. Verify that the `userManager` plugin is available:
 - a. Go to the following URL to access the Zope Management Interface (ZMI):

```
http://YourResource Manager:8080/zport/acl_users/manage
```
 - b. In the Name column, click **Plugins**.
 - c. Click **Authentication Plugins**.
 - d. Make sure that your LDAP plugin is first in the list of Active Plugins. (The `userManager` plugin must be below it.)

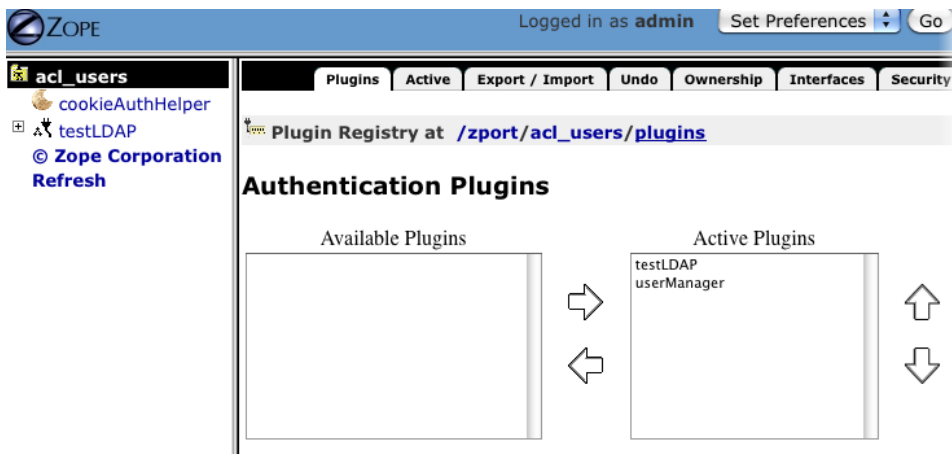

Figure 32.3. Authentication Plugins

2. Create a user with fallback capabilities. For example, to allow an LDAP user named "zenoss-user" to log in when the LDAP server is down:
 - a. Go to Advanced > Settings > Users > Add New User.
 - b. Create a user named "zenoss-user."

Note

You must create this account before the user logs in with the LDAP credentials. The password defined when creating the account in Resource Manager will be valid even when the LDAP server is down.

Chapter 33. Lightweight Directory Access Protocol (LDAP) Response Time

33.1. About

ZenPacks.zenoss.LDAPMonitor monitors the response time of an LDAP server (in milliseconds).

33.2. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss Version 2.2 or higher
Required ZenPacks	ZenPacks.zenoss.LDAPMonitor

Table 33.1. LDAP Monitoring Prerequisites

33.3. Enable Monitoring

The LDAPServer template must be bound to the device class or device you want to monitor.

33.3.1. For a Device

To enable monitoring for a device:

1. Select Infrastructure from the navigation bar.
2. Click the device name in the device list.

The device overview page appears.

3. Select Configuration Properties from the left panel.
4. Modify configuration property values as needed for your environment. Check with your LDAP administration for more information.

Property	Description
zLDAPBaseDN	The Base Distinguished Name for your LDAP server. Typically this is the organization's domain name (for example, dc=foobar,dc=com)
zLDAPBindDN	The Distinguished Name to use for binding to the LDAP server, if authentication is required
zLDAPBindPassword	The password to use for binding to the LDAP server, if authentication is required

Table 33.2. LDAPServer Configuration Properties

5. Click **Save**.
6. Expand Monitoring Templates, and then select Device from the left panel.
7. Select Bind Templates from the Action menu.

The Bind Templates dialog appears.

8. Add the LDAPServer template to the list of selected templates, and then click **Submit**.

The LDAPServer template is added to the list of monitoring templates.

9. Select the LDAPServer template and change options as needed.

Option	Description
Port	The port to connect to LDAP server (default 389)
Base Distinguished Name	Defaults to <code>\${here/zLDAPBaseDN}</code>
Bind Password	Defaults to <code>\${here/zLDAPBindPassword}</code>
Use SSL	Use SSL for the connection

Table 33.3. LDAPServer Basic Data Source Options

Note

If your LDAP servers require SSL or a custom port, select the ldap data source, and then change the Use SSL and Port fields as needed.

10. Validate your configuration by running `zencommand` and observing that the `check_ldap` or `check_ldaps` command correctly connects to your LDAP server:

```
zencommand run -v10 -d yourdevicenamehere
```

33.4. Daemons

Type	Name
Performance Collector	zencommand

Table 33.4. Daemons

Chapter 34. Mail Transactions

34.1. About

The ZenMailTx ZenPack allows you to monitor round-trip email delivery.

34.1.1. Events

There are several situations for which ZenMailTx will create events. The component will be `zenmailtx`, the event-Group will be `mail` and the eventClass will be `/Status`. These situations are:

- The SMTP server name or the POP server name cannot be resolved.
- The SMTP server or the POP server is down or unavailable.
- The timeout (specified on the Data Source tab) is exceeded for the SMTP or POP server.
- Authentication (if specified) with the SMTP or POP server fails.
- A threshold defined for one of the data points in this data source is exceeded. Thresholds are defined in the monitoring template that contains the data source.

Once an email has successfully made a trip back and forth, a clear event is created that clears any failure events.

34.2. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss 2.2 or higher
Required ZenPacks	ZenPacks.zenoss.ZenMailTx

Table 34.1. Mail Transactions Prerequisites

34.3. Enable Monitoring

1. Click the device in the device list.
2. From the left panel, select the Device template under Monitoring Templates.
3. Select Add Local Template from the Action menu.
4. Enter an identifier for the template (such as ZenMailTx), and then click **Submit** to create the template.
5. Click the newly created ZenMailTx template.
6. In the Data Sources area, click  to add a data source.
7. Enter a name for the data source (MailTx), select MAILTX as the type, and then click **Submit**.
8. Change options as needed.

Option	Description
To Address	The e-mail address that will appear in the <code>From:</code> field in the generated e-mail.
From Address	The e-mail address where the generated e-mail should be sent.
SMTP Host	The e-mail server where the e-mail should be sent.

Option	Description
POP Host	The POP server from which the test e-mail will be received.

Table 34.2. Mail Transactions Basic Data Source Options

Tip

Any of the `MAILTX` fields can take TAL expressions, including the password fields.

9. Click Save to save your changes.
10. Navigate to Graphs and you should see some place holders for graphs. After approximately fifteen minutes you should see the graphs begin populating with information.

34.4. Daemons

Type	Name
Performance Collector	<code>zenmailtx</code>

Table 34.3. Daemons

Chapter 35. MS Active Directory

35.1. About

The ActiveDirectory ZenPack allows you to monitor Microsoft Active Directory authentication metrics.

This ZenPack creates a device class for Microsoft Active Directory with appropriate priorities. It also creates a Windows Service class and IP Service class for Active Directory-related services with monitoring enabled.

Use the Active Directory ZenPack to monitor these metrics:

- DS Client Binds/Sec
- DS Directory Reads/Sec, Searches/Sec and Writes/Sec
- DS Monitor List Size
- DS Name Cache Hit Rate
- DS Notify Queue Size
- DS Search Sub-operations/Sec
- DS Server Binds/Sec, Server Name Translations/Sec
- DS Threads In Use
- KDC AS Requests, TGS Requests
- Kerberos Authentications
- LDAP Active Threads
- LDAP Bind Time
- LDAP Client Sessions
- LDAP New / New SSL and Closed Connections/Sec
- LDAP Searches/Sec, Writes/Sec
- LDAP Successful Binds
- LDAP UDP Operations/Sec
- NTLM Authentications

35.2. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss 2.2 or higher
Required ZenPacks	ZenPacks.zenoss.ZenWinPerf, ZenPacks.zenoss.ActiveDirectory

Table 35.1. Active Directory Monitoring Prerequisites

35.3. Enable Monitoring

All Active Directory services must have a device entry under the `/Devices/Server/Windows/Active Directory` device class. In addition, verify that your Resource Manager Windows service account has access to the Active Directory service.

1. Navigate to the device or device class in the Resource Manager interface.
 - If applying changes to a device class:
 - a. Select the class in the devices hierarchy.
 - b. Click **Details**.
 - c. Select Configuration Properties.
 - If applying changes to a device:
 - a. Click the device in the device list.
 - b. Select Configuration Properties.
2. Verify the credentials for the service account to access the service.

Name	Description
zWinUser	Windows user with privileges to gather performance information.
zWinPassword	Password for the above user.

Table 35.2. Active Directory Configuration Properties

3. Click Save to save your changes.

You will now be able to start collecting the Active Directory server metrics from this device.

4. Navigate to Graphs and you should see some placeholders for graphs. After approximately fifteen minutes you should see the graphs start to become populated with information.

35.4. Daemons

Type	Name
Performance Collector	zenwinperf

Table 35.3. Daemons

Chapter 36. MS Exchange

36.1. About

The MS Exchange ZenPack is an application monitoring ZenPack that monitors Microsoft Exchange and its related services. The ZenPack enables users to view graphs based on MS Exchange Performance Counters and to monitor processes related to MS Exchange.

36.2. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss Version 2.2 or higher
Required ZenPacks	ZenPacks.zenoss.ZenWinPerf, ZenPacks.zenoss.MSExchange

Table 36.1. MS Exchange Prerequisites

36.3. Enable Monitoring

All MS Exchange services must have a device entry under the `/Devices/Server/Windows/MSExchange` device class. In addition, verify that your Resource Manager Windows service account has access to the MS Exchange service.

1. Navigate to the device or device class in the Resource Manager interface.
 - If applying changes to a device class:
 - a. Select the class in the devices hierarchy.
 - b. Click **Details**.
 - c. Select Configuration Properties.
 - If applying changes to a device:
 - a. Click the device in the device list.
 - b. Select Configuration Properties.
2. Verify the credentials for the service account to access the service.

Name	Description
zWinUser	Windows user with privileges to gather performance information.
zWinPassword	Password for the above user.

Table 36.2. MS Exchange Configuration Properties

3. Click Save to save your changes.

You will now be able to start collecting the MS Exchange server metrics from this device.

4. Navigate to Graphs and you should see some placeholders for graphs. After approximately fifteen minutes you should see the graphs start to become populated with information.

36.4. Daemons

Type	Name
Performance Collector	zenwinperf

Table 36.3. Daemons

Chapter 37. Microsoft Message Queuing (MSMQ) Monitoring

37.1. About

The following description of Microsoft Message Queuing (MSMQ) can be found on Microsoft's MSMQ product page.

“Microsoft Message Queuing (MSMQ) technology enables applications running at different times to communicate across heterogeneous networks and systems that may be temporarily offline. MSMQ provides guaranteed message delivery, efficient routing, security, and priority-based messaging. It can be used to implement solutions for both asynchronous and synchronous messaging scenarios.”

The MSMQMonitor ZenPack described in this chapter allows Resource Manager to automatically discover queues and monitor how many messages are queued in each.

37.2. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss 2.5 or higher
Required ZenPacks	ZenPacks.zenoss.MSMQMonitor ZenPacks.zenoss.ZenWinPerf

Table 37.1. MSMQ Monitoring Prerequisites

37.3. Configuration

To monitor the MSMQ queues you must first follow the instructions in the Windows Performance chapter of this guide to setup proper credentials for Resource Manager to remotely monitor your Windows server. Once this is done you can take one of the following two approaches to enabled MSMQ queue monitoring.

37.3.1. Automatically Monitor Queues on All Servers

The easiest way to configure Resource Manager to monitor your queues is to enable queue discovery for the entire /Server/Windows device class. Within 12 hours Resource Manager will have automatically discovered all of the queues available to be monitored and begun monitoring how many messages are in each queue and creating threshold events if they exceed 10,000 messages.

Perform the following steps to enable queue discovery for all Windows servers.

1. Navigate to the /Server/Windows device class.
2. Click **Details**.
3. Select Modeler Plugins from the left panel.
4. Click Add Fields.
5. Drag zenoss.wmi.MSMQQueueMap from the available fields to the list of plugins.
6. Click Save.
7. Wait about 12 hours for all Windows servers to be remodeled.

37.3.2. Monitor Queues on Specific Servers

If you do not want Resource Manager automatically monitoring queues on all of your Windows servers and would rather point it to specific servers you can do so by performing the following steps on each server you're interested in.

1. Navigate to the device.
2. Select Modeler Plugins from the left panel.
3. Click Add Fields.
4. Drag `zenoss.wmi.MSMQQueueMap` from the available fields to the list of plugins.
5. Click Save.
6. Select Model Device from the Action menu.

37.3.3. Fine-Tuning Queue Monitoring

By default Resource Manager will automatically monitor all queues on a server that is running the MSMQ services. Each queue will also have a default 10,000 maximum threshold applied to it. This means that an event will be created when the number of messages in a single queue exceeds 10,000.

Note

By default queues with names beginning with `tcp` will not be discovered. You can change this behavior with the `zMSMQIgnoreQueues` property. This property is a regular expression and any queues that match it will not be discovered.

You can change the maximum messages threshold on a per-queue basis by changing the `Queues Messages Threshold` property. Leaving this value blank will have the result of no threshold being applied.

37.4. Daemons

Type	Name
Modeler	<code>zenmodeler</code>
Performance Collector	<code>zenwinperf</code>

Table 37.2. MSMQ Monitoring Daemons

Chapter 38. Microsoft Internet Information Services (IIS)

38.1. About

The IISMonitor ZenPack collects key metrics from Microsoft IIS. The metrics are collected using Windows Perfmon and does not require an agent to be installed on the IIS server.

- Connections Attempts
- Throughput (Bytes & Files)
- Requests (GET, HEAD, POST, CGI, ISAPI)
 - Standard: GET, HEAD, POST, CGI, ISAPI
 - WebDAV: PUT, COPY, MOVE, DELETE, OPTIONS, PROPFIND, PROPPATCH, MKCOL
 - Other: SEARCH, TRACE, LOCK, UNLOCK

38.2. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss 2.2 or higher
Required ZenPacks	ZenPacks.zenoss.ZenWinPerf, ZenPacks.zenoss.IISMonitor

Table 38.1. MS IIS Prerequisites

38.3. Enable Monitoring

All IIS servers must have a device entry in an organizer below the `/Devices/Server/Windows/WMI` device class. In addition, verify that your Resource Manager Windows service account has access to the IIS service.

1. Bind the IIS template to the `/Devices/Server/Windows/WMI` class. To do this:
 - a. Select the device class in the devices hierarchy.
 - b. Click **Details**.
 - c. Select Device_WMI under Monitoring Templates.
 - d. Select Bind Templates from the Action menu.

The Bind Templates dialog appears.

- e. Move IIS (`/Server/Windows/WMI`) from the Available area to the Selected area, and then click **Save**.
2. Navigate to the device or device class in the Resource Manager interface.
 - If applying changes to a device class:
 - a. Select the class in the devices hierarchy.
 - b. Click **Details**.
 - c. Select Configuration Properties.
 - If applying changes to a device:
 - a. Click the device in the device list.

- b. Select Configuration Properties.
- 3. Verify the credentials for the service account to access the service.

Name	Description
zWinUser	Windows user with privileges to gather performance information.
zWinPassword	Password for the above user.

Table 38.2. IIS Configuration Properties

- 4. Click Save to save your changes.

You will now be able to start collecting the IIS server metrics from this device.

- 5. Navigate to Graphs and you should see some placeholders for graphs. After approximately fifteen minutes you should see the graphs begin to be populated with information.

38.4. Daemons

Type	Name
Performance Collector	zenwinperf

Table 38.3. Daemons

Chapter 39. Microsoft SQL Server

39.1. About

The MSSQLServer ZenPack monitors Microsoft SQL Server and its related services. The ZenPack enables users to view graphs based on Microsoft SQL Server Performance Counters and to monitor processes related to SQL Server.

39.2. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss 2.2 or higher
Required ZenPacks	ZenPacks.zenoss.ZenWinPerf, ZenPacks.zenoss.MSSQLServer

Table 39.1. MS SQL Server Prerequisites

39.3. Enable Monitoring

All MS SQL Server services must have a device entry under the `/Devices/Server/Windows/MSSQLServer` device class. In addition, verify that your Resource Manager Windows service account has access to the MS SQL Server service.

1. Navigate to the device or device class in the Resource Manager interface.
 - If applying changes to a device class:
 - a. Select the class in the devices hierarchy.
 - b. Click **Details**.
 - c. Select Configuration Properties.
 - If applying changes to a device:
 - a. Click the device in the device list.
 - b. Select Configuration Properties.
2. Verify the credentials for the service account to access the service.

Name	Description
zWinUser	Windows user with privileges to gather performance information.
zWinPassword	Password for the above user.

Table 39.2. MS SQL Server Configuration Properties

3. Click **Save** to save your changes.

You will now be able to start collecting the MS SQL Server server metrics from this device.

4. Navigate to Graphs to see placeholders for graphs. After approximately fifteen minutes, the graphs start to become populated with information.

39.4. Collecting Information from Non-Default Microsoft SQL Server Instances

The default Microsoft SQL Server instance is `SQLServer`. The monitoring template delivered with the `MSSQLServer` ZenPack uses this default instance to gather performance metrics. If you use a non-default SQL Server instance, then Resource Manager does not automatically find and gather information about it.

To enable Resource Manager to monitor a non-default instance, you must override the monitoring template:

1. From Infrastructure > Devices, click the device on which you want to override the template.
2. Under Monitoring Templates, select the `MSSQLServer` template.
3. From the Action menu, select `Override Template Here`.

The `Override Templates` dialog appears.

4. Select the `MSSQLServer` template in the list, and then click **Submit**.

The template redisplay in the left panel, now identified as "Locally Defined."

5. For each of the data sources in the `Data Sources` area, perform these steps:
 - a. Double-click the data source to edit it.
 - b. In the `Perf Counter` field, change the text `"\SQLServer:"` to `"\MyInstance:"` (where *MyInstance* is the name of the Microsoft SQL Server database instance name).
 - c. Click **Save**.
6. Remodel the device.

39.5. Daemons

Type	Name
Performance Collector	<code>zenwinperf</code>

Table 39.3. Daemons

Chapter 40. Multi-Realm IP Networks

40.1. About

The Multi-Realm IP ZenPack functionality extends core modeling, monitoring, and event management in Resource Manager to allow for overlapping IP spaces. With this ZenPack, Resource Manager can prefix a realm identifier to the IP addresses on a given network to differentiate these addresses in Resource Manager.

There are two primary use cases for using multi-realm IP management.

- A large company that manages multiple locations that have the same network spaces defined across these multiple locations and as a result have created multiple overlapping IP spaces and Resource Manager needs a way to identify each separate IP space in the system.
- Service Providers responsible for monitoring multiple customers where the customers have created independent networks and IP spaces that are unique to their location, but not unique to the Service Provider.

The essential workflow for creating and using IP Realms is that first you need to create the IP realms and then associate these realms with a collector. The associations between IP Realms and actual devices is made automatically by the device's association with the collector. All devices on a collector are associated with the realm for that collector.

Note

The Multi-Realm IP ZenPack is available only by separate download from the Zenoss Support site.

After downloading the ZenPack, you must install it manually. In the Resource Manager interface, go to Settings > Zenpacks > Install Zenpack.

40.2. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss 2.2 or higher
Required ZenPacks	ZenPacks.zenoss.DistributedCollector, ZenPacks.zenoss.MultiRealmIP

Table 40.1. Multi-realm Prerequisites

40.3. Example System

The following diagram lays out an example setup. It has a central Resource Manager server in the 10.10.10.0/24 network. The network local to the Resource Manager server is considered the default network within the system. The default network is treated exactly the same as a Resource Manager system without Multi-Realm IP ZenPack installed.

There are two other networks shown (r_1 and r_2) which are behind a firewall and have the same IP space 192.168.0.0/24. Each realm has a distributed collector located within it. The collector can be accessed from the Resource Manager server using a IP translation from the firewall to map the address accessible from in front of the firewall to an address behind the firewall. Remote collectors in a multi-realm setup must be accessible from the central server using SSH.

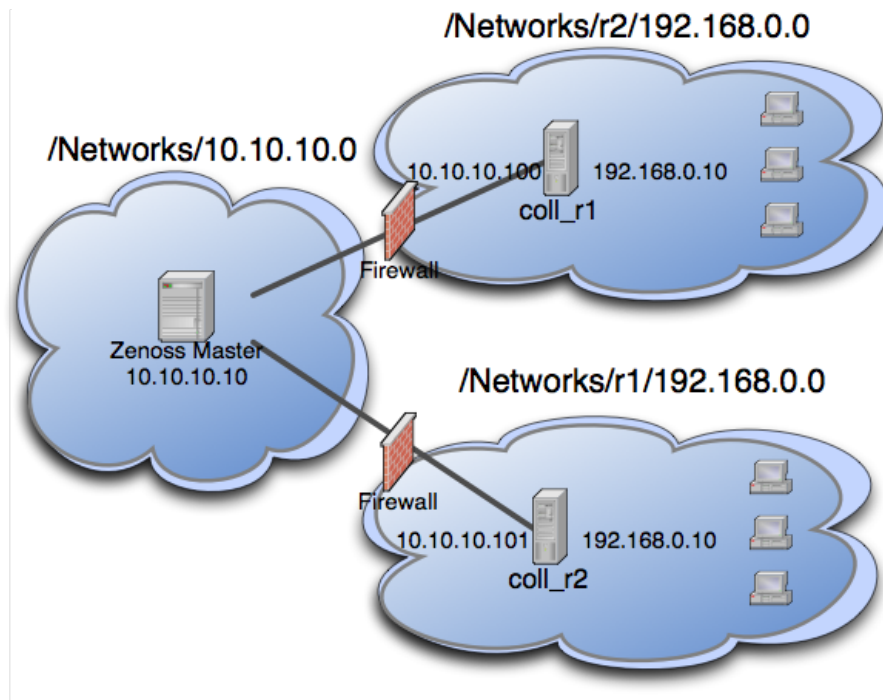

Figure 40.1. Example IP Realm

40.4. System Setup

Set up Resource Manager following the example system described above.

Tip

If you do not have overlapping IP space this example can be created using collectors within the same network. To create the example, add a machine multiple times once per collector, making sure to change the name of the device as it is added. The result is similar to a real realm setup.

Under multi-realm IP networks, device names *must* be unique even though the IP addresses will overlap.

On certain server configurations, if a distributed collector is configured, a "zenpack command failed" error occurs when installing this ZenPack. If you encounter this error, then run the following grant (as MySQL root):

```
grant super on *.* to 'zenoss'@'{FQDN_of_Zenoss_host}' identified by 'zenoss';
```

where the first 'zenoss' is the user account that Resource Manager uses to access MySQL, and the second 'zenoss' is that account's password.

40.4.1. Adding Realms

1. Go to Infrastructure > Networks.
2. From the Add menu, select Add IP Realm. Add the realms `r1` and `r2`.

40.4.2. Adding Collectors to Realms

1. Add the two collectors that are installed in each realm.

Distributed collectors now have an IP Realm field on their configuration screen set each collector to the appropriate realm configured above.

2. Change each collector so that it is in the correct realm.

40.4.3. Adding Devices to Realms

1. Now we are ready to add devices to the system. As mentioned above, adding the same device to the system twice can simulate a multi-realm setup. Add a device called `A.test` making sure that when it is added the collector is set to one of the remote collectors, and not `localhost`.
2. Now rename the device.
3. Add the device a second time using your other collector, again not `localhost`.
4. After the device is loaded, select Software and follow the network link on one of the interfaces. Notice that the network has been created underneath the realm created earlier. This configuration is at the heart of multi-realm, as networks are discovered they are created within each realm.

Monitoring is now happening on each representation of the device from the different collectors in different overlapping realms.

As another test try searching by IP from the top-level search. Two devices will be returned -- one within each realm.

40.5. Notes

- If an event contains the unique name of a device then it is straight-forward to assign it to the proper device. If only the IP address is sent the event will be assigned by looking up the IP within the context of the realm.
- If a device is moved between realms it must be remodeled so that its IPs are placed in the proper location.
- The Network Map only supports the display the default realm.

Chapter 41. MySQL Database

41.1. About

MySqlMonitor provides a method for pulling performance metrics from the MySQL database server directly into Resource Manager without requiring the use of an agent. This is accomplished by using the MySQL client library to connect to the database remotely.

The following metrics are collected and graphed for MySQL server:

- Command Statistics (SELECT, INSERT, UPDATE, DELETE)
- Select Statistics (Scan, Range Check, Range Join, Full Join)
- Handler Statistics (Keyed and Unkeyed Reads, Writes, Updates, Deletes)
- Network Traffic (Received and Sent)

41.2. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss 2.2 or higher
Required ZenPacks	ZenPacks.zenoss.MySqlMonitor
MySQL client	Each remote collector must have an installed MySQL client

Table 41.1. MySQL Prerequisites

41.3. Enable Monitoring

Use the following procedures to enable monitoring.

41.3.1. Authorize MySQL Performance Data Access

Follow these steps to set up your MySQL server to allow Resource Manager to read performance data from the system tables.

1. Connect to the MySQL database by using the MySQL client:

```
mysql -u root
```

Alternatively, if there is a MySQL root password:

```
mysql -u root -p
```

2. Create a user for Resource Manager to use.

```
mysql> CREATE USER Name IDENTIFIED BY 'ResourceManagerPassword';
```

```
Query OK, 0 rows affected (0.00 sec)
```

41.3.2. Set up Resource Manager

1. Select Infrastructure from the navigation bar.
2. Click the device name in the device list.

The device overview page appears.

3. Select Configuration Properties from the left panel.
4. Edit the zMySQLRootPassword configuration property for the device or devices in Resource Manager on which you want to monitor MySQL.
5. Click **Save**.
6. Expand Monitoring Templates, and then select Device from the left panel.
7. Select Bind Templates from the Action menu.

The Bind Templates dialog appears.

8. Add the MySQL template to the list of selected templates, and then click **Submit**.

The MySQL template is added to the list of monitoring templates.

Note

Pay particular attention to the MySQL Version 5+ setting in the data source. If you are monitoring pre-v5 installations of MySQL, then you must set this value to False. If you are monitoring pre-v5 and v5+ installations, then create two templates: one for MySQL installations earlier than v5 and another for those after.

41.4. Daemons

Type	Name
Performance Collector	zencommand

Table 41.2. Daemons

Chapter 42. NetApp Filers

42.1. About

NetAppMonitor provides additional modeling and monitoring for NetApp devices. NFS, CIFS and HTTP operations per second are collected, as well as file system and snapshot utilization information. Hardware model and operating system revision asset information is modeled.

The NetApp ZenPack uses reports (IIRC) provided by the StorageBase ZenPack.

Asset information:

- Hardware Model
- Operating System Revision

Device metrics:

- Network bits/sec: Send and Received
- Operations/sec: NFS, CIFS and HTTP

File system metrics:

- File system utilization (90% threshold)
- Snapshot utilization (120% threshold)

NetApp uses SSH to model NFS clients of file systems. It uses SNMP to model:

- Disks, storage enclosures, RAID groups, Plexes, Aggregates, Volumes, LUNs and QTrees
- LUN clients
- Licenses

Note

Sizes reported by the NetAppMonitor ZenPack are approximate, as values for many objects (Aggregate, Volume, Plex, and RAID group) are not exposed by the NetApp MIB.

It uses SNMP to monitor:

- iSCSI, Fibre Channel, and per LUN throughput
- Disk inventory (active, spare, pre-failed, or failed)
- Disk maintenance activity (scrubbing, reconstructing, parity reconstructing, verifying parity)
- NFS v3 statistics
- NFS cache statistics
- CIFS statistics

42.1.1. Performance Graphs

Performance graphs provided with this ZenPack include:

- NFSv3 Operations
- Fibre Channel Traffic

- iSCSI Traffic
- NFS Caching Statistics
- Disk Inventory
- Disk Maintenance

42.2. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss 3.x or higher
Required ZenPacks	ZenPacks.zenoss.NetAppMonitor ZenPacks.zenoss.StorageBase

Table 42.1. NetApp Prerequisites

42.3. Enable Monitoring

42.3.1. Configuring NetApp Devices to Allow SNMP Queries

Configure the NetApp devices to allow SNMP queries from the Resource Manager server, and send SNMP v1 or SNMP v2 traps to the Resource Manager server.

42.3.2. Configuring Resource Manager

All NetApp devices must exist under the `/Devices/Storage/NetApp` device class.

1. Navigate to the device or device class in the Resource Manager interface.
 - If applying changes to a device class:
 - a. Select the class in the devices hierarchy.
 - b. Click **Details**.
 - c. Select Configuration Properties.
 - If applying changes to a device:
 - a. Click the device in the device list.
 - b. Select Configuration Properties.
2. Edit the appropriate configuration properties for the device or devices.

Name	Description
zSnmCommunity	Consult with your storage administrators to determine the SNMP community permitted.
zSnmPort	The default port is 161.
zSnmVer	Set to v2c.

Table 42.2. NetApp Configuration Properties

3. Click Save to save your changes. You will now be able to start collecting the NetApp metrics from this device.
4. Navigate to Graphs and you should see some placeholders for graphs. After approximately fifteen minutes you should see the graphs start to become populated with information.

42.4. Using SSH to Model NFS Clients

To use SSH to model NFS clients, you must:

1. Allow SSH logins to the NetApp server.
2. Set the configuration properties `zCommandPassword` and `zCommandUser`.
3. Remodel the device.

42.5. Forwarding syslog Events from NetApp

To forward syslog events from NetApp:

1. From the NetApp interface, click the Filer menu.
2. Click the Configure Syslog menu item.
3. Click the New Action button.
4. Add the following, *separating each field with a tab*.

```
*.* @yourzenosserver
```

5. Click **OK**.

You can test the configuration by logging in to the command line on the NetApp server, and then entering the following command:

```
logger Hello World
```

This should result in an event with the subject "Hello World" appearing in the Resource Manager event console. To restart the daemon, enter:

```
syslog reset_syslog
```

42.6. Daemons

Type	Name

Type	Name
Modeler	zenmodeler
Performance Collector	zenperfsnmp

Table 43.3. Daemons

Chapter 44. Network News Transport Protocol (NNTP)

44.1. About

ZenPacks.zenoss.NNTPMonitor ZenPack monitors the response time of an NNTP server in milliseconds.

44.2. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss Version 2.2 or higher
Required ZenPacks	ZenPacks.zenoss.NNTPMonitor

Table 44.1. NNTP Prerequisites

44.3. Enable Monitoring

To enable monitoring for a device:

1. Select Infrastructure from the navigation bar.
2. Click the device name in the device list.

The device overview page appears.

3. Expand Monitoring Templates, and then select Device from the left panel.
4. Select Bind Templates from the Action menu.

The Bind Templates dialog appears.

5. Add the NNTPMonitor template to the list of selected templates, and then click **Submit**.

The NNTPMonitor template is added to the list of monitoring templates.

6. Select the template and change options as needed.
7. Validate your configuration by running **zencommand** and observing that the **check_nntp** or **check_nntps** command correctly connects to your NNTP server:

```
zencommand run -v10 -d yourdevicenamehere
```

44.4. Daemons

Type	Name
Performance Collector	zencommand

Table 44.2. Daemons

Chapter 45. Network Time Protocol (NTP)

45.1. About

ZenPacks.zenoss.NtpMonitor monitors the offset between system time and a target NTP (Network Time Server) server's time.

45.2. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss Version 2.2 or higher
Required ZenPacks	ZenPacks.zenoss.NtpMonitor

Table 45.1. NTP Prerequisites

45.3. Enable Monitoring

The NTPMonitor template must be bound to the device class or device you want to monitor.

1. Select Infrastructure from the navigation bar.
2. Click the device name in the device list.

The device overview page appears.

3. Expand Monitoring Templates, and then select Device from the left panel.
4. Select Bind Templates from the Action menu.

The Bind Templates dialog appears.

5. Add the NTPMonitor template to the list of selected templates, and then click Submit.

The NTPMonitor template is added to the list of monitoring templates. You can now start collecting the NTP server metrics from this device.

45.4. Daemons

Type	Name
Performance Collector	zencommand

Table 45.2. Daemons

Chapter 46. Nexus7k

46.1. About

The Nexus7k ZenPack monitors Cisco Nexus® 7000 series switches, using SSH and SNMP. The Cisco NX-OS software platform that runs on the Nexus 7000 switches allows you to create multiple Virtual Device Contexts (VDCs). Each context has its own management IP address. The Nexus 7000 ZenPack presents the VDCs as components of a single device. Further, the interfaces and VLANs that are modeled as components are presented with an additional column that indicates the VDC to which they belong.

The Nexus7k ZenPack requires that all VDCs be configured with the same SSH and SNMP credentials.

46.2. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.1 or later version
Required ZenPacks	ZenPacks.zenoss.Nexus7k ZenPacks.zenoss.EnterpriseReports ZenPacks.zenoss.CiscoMonitor

Table 46.1. Datacenter View Prerequisites

46.3. Adding a Cisco Nexus 7000 Device for Monitoring

Follow these steps to add a device to monitor:

1. From the Resource Manager interface, select Infrastructure > Devices.

The Device list appears.

2. In the left panel, navigate to the /Network/Cisco/Nexus/7000 device class.
3. From the Add list of options, select Add Cisco Nexus.

Figure 46.1. Add Cisco Nexus Selection

The Add Cisco Nexus dialog appears.

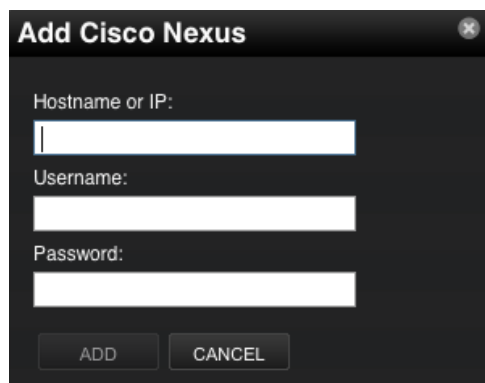

Figure 46.2. Add Cisco Nexus Dialog

4. Enter the host name or IP address of the Nexus 7000 device.
5. Enter SSH credentials in the Username and Password fields.

Note

To change SNMP credentials, go to the Configuration Properties page for the device or device class.

6. Click **Add**.

46.4. Monitoring Credentials

The following configuration properties must be set if using SSH:

Name	Description
zCommandUsername	Nexus 7000 user
zCommandPassword	Password for the Nexus 7000 user

Table 46.2. Nexus7k Configuration Properties - SSH

The following configuration property must be set if using SNMP:

Name	Description
zSnmpCommunity	Consult with your storage administrators to determine the SNMP community permitted.

Table 46.3. Nexus7k Configuration Properties - SNMP

46.5. Daemons

Type	Name
Modeler	zenmodeler
Performance Collector	zenperfsnmp

Table 46.4. Daemons

Chapter 47. Nortel Devices

47.1. About

The NortelMonitor ZenPack allows you to monitor Nortel devices.

47.2. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss 2.2 or higher
Required ZenPacks	ZenPacks.zenoss.NortelMonitor

Table 47.1. Nortel Prerequisites

47.3. Enable Monitoring

47.3.1. Configuring Nortel Devices to Allow SNMP Queries

Configure the Nortel device to allow SNMP queries from the Resource Manager server, and send SNMP v1 or SNMP v2 traps to the Resource Manager server.

47.3.2. Configuring Resource Manager

All Nortel devices must exist under the `/Devices/Network/Nortel` device class.

1. Navigate to the device or device class in the Resource Manager interface.
 - If applying changes to a device class:
 - a. Select the class in the devices hierarchy.
 - b. Click **Details**.
 - c. Select Configuration Properties.
 - If applying changes to a device:
 - a. Click the device in the device list.
 - b. Select Configuration Properties.
2. Edit the appropriate configuration properties for the device or devices.

Name	Description
zSnmpCommunity	Consult with your network administrators to determine the SNMP community permitted.
zSnmpMonitorIgnore	This should be set to <code>False</code>
zSnmpPort	The default port is 161.
zSnmpVer	This should be set to <code>v2c</code>

Table 47.2. Nortel Configuration Properties

3. Click Save to save your changes. You will now be able to start collecting the Nortel device metrics from this device.

4. Navigate to Graphs and you should see some placeholders for graphs. After approximately fifteen minutes you should see the graphs start to become populated with information.

47.4. Daemons

Type	Name
Modeler	zenmodeler
Performance Collector	zenperfsnmp

Table 47.3. Daemons

Chapter 48. ONC-Style Remote Procedure Call (RPC)

48.1. About

ZenPacks.zenoss.RPCMonitor monitors the availability of an ONC RPC server.

48.2. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss Version 2.2 or higher
Required ZenPacks	ZenPacks.zenoss.RPCMonitor

Table 48.1. ONC RPC Prerequisites

48.3. Enable Monitoring

The RPCMonitor template must be bound to the device class or device you want to monitor. Follow these steps to enable monitoring:

1. Select Infrastructure from the navigation bar.
2. Click the device name in the device list.

The device overview page appears.

3. Select Configuration Properties from the left panel.
4. Set the appropriate RPC command to test in the zRPCCommand configuration property (for example, nfs or ypsserv).
5. Click **Save**.
6. Expand Monitoring Templates, and then select Device from the left panel.
7. Select Bind Templates from the Action menu.

The Bind Templates dialog appears.

8. Add the RPCServer template to the list of selected templates, and then click **Submit**.

The RPCServer template is added to the lists of monitoring templates. You can now collect the RPCServer server metrics from the device.

48.4. Daemons

Type	Name
Performance Collector	zencommand

Table 48.2. Daemons

Chapter 49. Oracle

49.1. About

The Oracle Monitoring ZenPack (DatabaseMonitor) monitors an Oracle database server. The ZenPack enables users to view graphs based on interface from Oracle performance tables.

49.2. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss 2.2 or higher
Required ZenPacks	ZenPacks.zenoss.DatabaseMonitor

Table 49.1. Oracle Prerequisites

Note

The Oracle ZenPack (ZenPacks.zenoss.DatabaseMonitor) is not available at the Enterprise Download site by default for legal reasons. It is also not included in the Enterprise ZenPacks RPM file.

Oracle requires each user to complete a license agreement prior to receiving this ZenPack. Upon completion, Zenoss Support will enable the ZenPack. You will be notified via a new case in the Zenoss Support Portal when the ZenPack is available. This ZenPack will be located in the `zenpacks` directory at the Enterprise Download site as both a 32-bit and a 64-bit version.

After downloading the ZenPack, you must install it manually. In the Resource Manager interface, go to Advanced > Settings, select ZenPacks in the left panel, and then select Install ZenPack from the Action menu.

49.3. Enable Monitoring

49.3.1. Authorize Oracle Performance Data Access

The default Oracle monitoring template queries the `v$statname` and `v$sysstat` views for performance metrics. You must get a login to the Oracle instance with read privileges to these tables at the minimum. You must also provide read privileges any other custom tables or views you plan to monitor.

49.3.2. Configure Resource Manager

Oracle monitoring can be applied to any device in the system by binding the Oracle template and configuring a few properties. The following steps illustrate how you would add Oracle monitoring to a Windows server called `oraprod1.example.com`.

1. Select the `oraprod1.example.com` device in the device list.
2. In the left panel, select Configuration Properties.
3. Set the following Oracle-related properties.
 - `zOracleConnectionString`: Optionally used instead of the following separate options.
 - `zOracleInstance`: Oracle SID
 - `zOraclePassword`: Password for the Oracle account
 - `zOraclePort`: Port number for the Oracle instance
 - `zOracleUser`: Username for the Oracle account

4. Click Save.
5. Select Bind Templates from the Action menu.
6. Move the Oracle template from the list of Available templates to the Selected area.
7. Click Save.

You will now be able to find the following additional graphs on the device. It may take up to fifteen minutes to start displaying values. You can check the device's event console for any errors related to the Oracle collection.

49.4. Monitor Additional SIDs

To monitor performance data from an additional SID on the same device you must make a copy of the default Oracle template and adjust its instance property.

1. Navigate to Advanced -> Monitoring Templates.
2. Highlight the /Devices under the Oracle template.
3. Choose Override Template from the action menu.
4. Choose your Oracle server from the list.
5. Click Submit.
6. Highlight the new Oracle template for your Oracle server.
7. Choose View and Edit Details from the gear menu.
8. Change the template name from Oracle to Oracle??? where ??? is the SID.
9. Click Submit.
10. Highlight the Oracle template for your Oracle server.

49.5. Monitoring Other Tables or Views

The Oracle data source also allows monitoring of other data contained within the database. You will need to build a query that returns a table in the following format.

Data Point Name	Numeric Value
firstValue	123
secondValue	45.6

Table 49.2. Example Query Results

Once you have a result set conforming to this name, value column specification you can add a new Oracle data source to a new or existing template using the following steps.

1. Optionally create a new monitoring template for the data source.
2. Edit the monitoring template.
3. Add a new Oracle data source to the template.
4. Fill out all of the data source fields as required to make the query.
5. Add one data point to the new data source for each row.

Note

The data point name must match the value in the first column of the result set exactly. For the example result set shown above you would create a data point named `firstValue` and another named `secondValue`.

49.6. Daemons

Type	Name
Performance Collector	zencommand

Table 49.3. Daemons

Chapter 50. Predictive Thresholding

50.1. About

The ZenHoltWinters ZenPack adds the ability to create threshold events when a device exceeds cyclical predicted values. The Holt-Winters exponential smoothing algorithm is used for this prediction.

For more information on RRD and Holt-Winters, see the **rrdcreate** command for more information.

Warning

Resource Manager relies on the existence of Holt-Winters RRAs within an RRD file. After adding Holt-Winters thresholds the RRD files will need to be re-created so that the new configuration can occur. You will have to remove any existing RRD files so that new files can be created.

Removing RRD files will remove all historical information associated with these RRD files.

50.2. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss 2.2 or higher
Required ZenPacks	ZenPacks.zenoss.ZenHoltWinters

Table 50.1. Prerequisites

50.3. Add a Predictive Threshold

1. Navigate to the template that you want to modify.
2. From the Thresholds area, click  (Add Threshold).
3. Provide a name for the new threshold and select the `HoltWintersFailure` threshold type, and then click **Add**.
4. Choose the data source to which the threshold should be applied.
5. Specify the parameters for the prediction engine.

Name	Description
Rows	The number of points to use for predictive purposes.
Alpha	A number from 0 to 1 that controls how quickly the model adapts to unexpected values.
Beta	A number from 0 to 1 that controls how quickly the model adapts to changes in unexpected rates changes.
Season	The number of primary data points in a season. Note that Rows must be at least as large as Season.

Table 50.2. Predictive Threshold Data Source Threshold Options

6. Click Save to save your changes.
7. Remove the RRD file or files that correspond to the data source selected in a previous step.

```
cd $ZENHOME/perf/Devices
```

```
rm device_names/DataSource_DataPoint.rrd
```

Note

Removing the RRD files does result in a loss of historical information.

Chapter 51. RANCID Integration

51.1. About

The RANCIDIntegrator ZenPack allows integration between the popular RANCID configuration management tool and Resource Manager. The integration points between the tools are:

- Resource Manager will build the `router.db` file for RANCID. This allows for the centralization of administration activities and reduces the duplication of effort normally required to maintain the two tools.
- Implementation of this feature is as easy as adding a **cron** job to execute `$ZENHOME/bin/zenrancid` to update the `router.db` file.
- Resource Manager will automatically run RANCID's **rancid-runm** tool on a single device in response to a `ciscoConfigManEvent` SNMP trap being sent from the device to Resource Manager. Cisco devices will send this trap whenever their configuration is changed. This allows for real-time capturing of router configuration changes in your CVS repository.

Note

The RANCID integrator is dependent on a connection to the Zope server, hence it can run only on the Resource Manager master and as such works only with managed resources on the master.

51.2. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss 2.2 or higher
Required ZenPacks	ZenPacks.zenoss.RANCIDIntegrator

Table 51.1. RANCID Prerequisites

51.3. Enable Integration

51.3.1. Configure Cisco Devices to Send Traps

To implement this feature you must configure your Cisco devices to send their SNMP traps to the Resource Manager server.

Link from Cisco device status pages to the most recent configuration stored in your CVS repository via `viewvc`.

51.3.2. Configure RANCID Update Information in Resource Manager

1. From Infrastructure >Devices, click the device in the device list.
2. Select Configuration Properties in the left panel.
3. Edit the appropriate configuration properties for the device.

Name	Description
<code>zRancidRoot</code>	File system directory where RANCID is installed. It may be NFS mounted from the RANCID server. Default is <code>/opt/rancid</code>
<code>zRancidUrl</code>	Base URL to viewvc

Name	Description
zRancidGroup	RANCID group attribute. Controls what <code>router.db</code> file the device is written to. Can be set at the device class or device level. Default is <code>router</code> on the <code>/Network/Router/Cisco</code> class
zRancidType	RANCID type attribute. Controls what device type is written to the <code>router.db</code> file. Can be set at the device class or device level. Default is <code>cisco</code> on the <code>/Network/Router/Cisco</code>

Table 51.2. RANCID Configuration Properties

4. Click Save to save your changes.

Chapter 52. Solaris

52.1. About

The SolarisMonitor ZenPack enables Resource Manager to use Secure Shell (SSH) to monitor Solaris hosts. Resource Manager models and monitors devices placed in the `/Server/SSH/Solaris` device class by running commands and parsing the output. Parsing of command output is performed on the Resource Manager server (if using a local collector) or on a distributed collector. The account used to monitor the device does not require root access or special privileges.

The SolarisMonitor ZenPack provides:

- File system and process monitoring
- Network interfaces and route modeling
- CPU utilization information
- Hardware information (memory, number of CPUs, and model numbers)
- OS information (OS-level, command-style information)
- Pkginfo information (such as installed software)

52.2. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss 2.5 or higher
Required ZenPacks	ZenPacks.zenoss.SolarisMonitor
Solaris releases supported	OpenSolaris 5.11, Solaris 9 and 10

Table 52.1. Solaris Prerequisites

Note

If using a distributed collector setup, SSH requires firewall access (by default, port 22) from the collector to the monitored server.

52.3. Limitations

The SolarisMonitor ZenPack does not support monitoring in Solaris Zones or systems containing Solaris Zones. (Implemented with Solaris 10, Solaris Zones act as isolated virtual servers within a single operating system instance.)

52.4. Set Solaris Server Monitoring Credentials

All Solaris servers must have a device entry in an organizer below the `/Devices/Server/SSH/Solaris` device class.

Note

The SSH monitoring feature will attempt to use key-based authentication before using a configuration properties password value.

1. Navigate to the device or device class in the Resource Manager interface.
 - If applying changes to a device class:
 - a. Select the class in the devices hierarchy.

- b. Click **Details**.
 - c. Select Configuration Properties.
 - If applying changes to a device:
 - a. Click the device in the device list.
 - b. Select Configuration Properties.
2. Verify the credentials for the service account to access the service.

Name	Description
zCommandUsername	Solaris user with privileges to gather performance information
zCommandPassword	Password for the Solaris user

Table 52.2. Solaris Configuration Properties

3. Click Save to save your changes.

52.5. Enable Monitoring

These steps assume that credentials have been set.

1. From Infrastructure > Devices, select select Add a Single Device from  (Add Device menu).
2. Enter the following information:

Name	Description
Device Name	Solaris host to model
Device Class Path	/Server/SSH/Solaris
Discovery Protocol	Set this to <code>auto</code> unless adding a device with a username and password different than found in the device class. If you set this to <code>none</code> , then you must add the credentials (see Section 52.4, “Set Solaris Server Monitoring Credentials”), and then manually model the device.

Table 52.3. Adding Solaris Device Information

3. Click **Add** to add the device.

52.6. Resolving CHANNEL_OPEN_FAILURE Issues

The **zencommand** daemon's log file (`$ZENHOME/collector/zencommand.log`) may show messages stating:

```
ERROR zen.SshClient CHANNEL_OPEN_FAILURE: Authentication failure
WARNING:zen.SshClient:Open of command failed (error code 1): open failed
```

If the **sshd** daemon's log file on the remote device is examined, it may report that the `MAX_SESSIONS` number of connections has been exceeded and that it is denying the connection request. In the OpenSSH daemons, this `MAX_SESSIONS` number is a compile-time option and cannot be reset in a configuration file.

To work around this **sshd** daemon limitation, use the configuration property `zSshConcurrentSessions` to control the number of connections created by **zencommand** to the remote device:

1. Navigate to the device or device class in the Resource Manager interface.

- If applying changes to a device class:
 - a. Select the class in the devices hierarchy.
 - b. Click **Details**.
 - c. Select Configuration Properties.
 - If applying changes to a device:
 - a. Click the device in the device list.
 - b. Select Configuration Properties.
2. Apply an appropriate value for the maximum number of sessions.

Name	Description
zSshConcurrentSessions	Maximum number of sessions supported by the remote device's <code>MAX_SESSIONS</code> parameter. Common values for Solaris is 2 or 10.

Table 52.4. Concurrent SSH Configuration Properties

3. Click **Save** to save your changes.

52.7. Resolving Command time out Issues

The `zencommand` daemon's log file (`$ZENHOME/collector/zencommand.log`) may show messages stating:

```
WARNING:zen.zencommand:Command timed out on device device_name: command
```

If this occurs, it usually indicates that the remote device has taken too long to return results from the commands. To increase the amount of time to allow devices to return results, change the configuration property `zCommandCommandTimeout` to a larger value:

1. Navigate to the device or device class in the Resource Manager interface.
 - If applying changes to a device class:
 - a. Select the class in the devices hierarchy.
 - b. Click **Details**.
 - c. Select Configuration Properties.
 - If applying changes to a device:
 - a. Click the device in the device list.
 - b. Select Configuration Properties.
2. Apply an appropriate value for the command timeout.

Name	Description
zCommandCommandTimeout	Time in seconds to wait for commands to complete on the remote device.

Table 52.5. SSH Timeout Configuration Properties

3. Click **Save** to save your changes.

52.8. Daemons

Type	Name
Modeler	zenmodeler

Type	Name
Performance Collector	zencommand

Table 52.6. Daemons

Chapter 53. Splunk Monitoring

53.1. About

Splunk is a search engine for IT data. It lets you search and analyze all the data your IT infrastructure generates from a single location in real time. More information on Splunk can be found online at <http://www.splunk.com/>.

The Splunk ZenPack allows you to monitor the results of a Splunk search. The total count returned by a search can be recorded, thresholded and graphed as well as additional tabular data contained within the results of more advanced searches that make use of Splunk's top filter. The value of monitoring Splunk searches is that it adds an easy and flexible way to monitor log data at aggregate level instead of on a log-by-log basis.

53.2. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss 2.4 or higher
Required ZenPacks	ZenPacks.zenoss.Splunk
Third Party Software	Splunk Version 3 or 4

Table 53.1. Splunk Monitoring Prerequisites

53.3. Splunk Data Source Type

The Splunk ZenPack adds the new Splunk data source type to your Resource Manager system. This data source can be used to monitor the results of Splunk searches.

The Splunk data source type has the following fields in common with many other Resource Manager data source types:

- Name: The name given to your data source.
- Enabled: This data source will only be polled if enabled is set to true.

In the event that the Splunk search fails to execute successfully an event will be generated. The following fields control key fields in the generated event. It is important to note that these fields only apply when the Splunk search fails to execute, and not when a threshold on the data point is breached.

- Component
- Event Class
- Event Key
- Severity

The following fields are specific to Splunk type data sources.

- Splunk Server: Hostname or IP address of your Splunk server. If left blank the `SPLUNK_SERVER` environment variable will be used.
- Splunk Port: Port that the splunkd daemon is listening on. Default is 8089. If left blank the `SPLUNK_PORT` environment variable will be used.
- Splunk Username: Splunk username. Default is admin. If left blank the `SPLUNK_USERNAME` environment variable will be used.

- Splunk Password: Splunk password. Default is changeme. If left blank the `SPLUNK_PASSWORD` environment variable will be used.
- Search: Search string exactly as it would be typed into the Splunk search engine. Be careful to use full quotes and not apostrophes where necessary.

53.4. Monitoring Splunk Searches

53.4.1. Monitoring Results of a Simple Search

The easiest way to get started monitoring your Splunk searches is with a simple search. The following steps will illustrate a simple way to build dynamic Splunk search monitoring.

This example demonstrates how to detect brute-force password cracking attempts on all Linux servers.

1. Build a search in Splunk to verify that you're getting the expected data. This example shows a query of `host="zendev.damsel.loc" minutesago=5 "failed password"`.

The screenshot shows a Splunk search interface. At the top, the search string `host="zendev.damsel.loc" minutesago=5 "failed password"` is entered in a search bar, which is highlighted with a red box. To the right of the search bar is a button labeled "Last 7 days". Below the search bar, a message states "Your timerange was substituted based on your search string". A green checkmark icon is followed by the text "104 matching events". To the right of this text are buttons for "Save search" and a bar chart icon. Below this, the "Timeline" section shows "zoom in" and "zoom out" buttons, and the "Scale" section shows "linear" and "log" options. The main results area shows "104 events in the last 7 days (from 10:04:30 PM to 10:09:30 PM on Saturday, October 3, 2009)". Below this, there are icons for list, table, and grid views, and a link for "Options...". A pagination bar shows "prev", "1", "2", "3", "4", "5", "6", "7", "8", "9", "10", and "next". The first result is a log entry: "1 10/3/09 10:09:00.000 PM Oct 3 22:09:00 zendev sshd[25020]: Failed password for root from port 38969 ssh2". Below the log entry, there are dropdown menus for "host=zendev.damsel.loc", "sourcetype=linux_secure", and "source=/var/log/secure".

Note

Using a time specifier such as `minutesago=5` within your search can be a useful trick when it comes to monitoring searches from Resource Manager. We will have Resource Manager automatically replace `zendev.damsel.loc` with the appropriate hostname using a `$(here/id)` TALES expression.

2. Create a Resource Manager monitoring template for monitoring this Splunk search.
 - a. From Advanced > Monitoring Templates, click  to add a monitoring template.

The Add Template dialog appears.

- b. Enter SplunkLinux in the Name field and select Linux in /Service/Linux for Template Path, and then click **Submit**.
- c. Select the newly created template.
- d. Add a Splunk data source to capture the count of failed passwords.
 - i. In the Data Sources area, click  to add a data source.
 - ii. In the Add Data Source dialog, set the Name to failedPassword and the Type to `Splunk`, and then click OK.
 - iii. Double-click the data source to configure it as follows, and then click Save.
 - Splunk Server: *Hostname or IP of your Splunk server*
 - Splunk Port: 8089
 - Splunk Username: *Splunk username* (default is admin)
 - Splunk Password: *Splunk password* (default is changeme)
 - Search: `host="{here/id}" minutesago=5 "failed password"`
 - iv. Add the *count* data point to the *failedPassword* data source.
 - A. Select Add Data Point from the Data Sources Action menu.
 - B. Set the Name to count and click OK.
 - v. Add a threshold of how many failed passwords constitutes an attack.
 - A. In the Thresholds area, click  to add a threshold.
 - B. Set the Name to password attack and Type to `MinMaxThreshold`, and then click Add..
 - C. Select `failedPassword_count` from Data Points.
 - D. Set the Max Value to 10.
 - E. Set the Event Class to `/Security/Login/BadPass`.
 - F. Click Save.
 - vi. Add a graph to visualize failed passwords per 5 minutes.
 - A. In the Graph Definitions area, click  to add a graph.
 - B. Set the Name to Splunk - Failed Passwords, and then click **Submit**.
 - C. Double-click the newly created graph to edit it.
 - D. Set the Units to `failed/5min`.
 - E. Set the Min Y to 0.
 - F. Select Manage Graph Points from the Action menu in the Graph Definitions area.

The Manage Graph Points dialog appears.
 - G. Select Data Point from the Add menu.

The Add Data Point dialog appears.
 - H. Select `failedPassword_count` from Data Point, and then click **Submit**.

- I. Click into the new count graph point.
 - J. Set the RPN to 300,* to adjust from failed/sec to failed/5min.
 - K. Set the Format to %6.1f.
 - L. Set the Legend to Count.
 - M. Click Save.
- vii. Bind the SplunkLinux template to the `/Server/Linux` device class.
- A. From Infrastructure > Devices, navigate to the `/Server/Linux` device class.
 - B. Click Details.
 - C. Select Bind Templates from the Action menu.
 - D. Move the `SplunkLinux` template from the Available area to the Selected area, and then click **Save**.

Now you will have a Failed Passwords graph on all of your Linux servers that visualizes how many failed password attempts have occurred over the last 5 minutes. You will also get a warning severity event anytime more than 10 failed password attempts are made within a 5 minute period.

53.4.2. Monitoring Results of a Top Search

Monitoring additional data points within a top search builds on monitoring a simple search. You can extra numeric data from the tabular results returned from a top search using the following steps.

This example demonstrates how you can monitor the logs by source type for all Linux devices.

1. Build a search in Splunk to verify that you're getting the expected data. This example shows a query of `host="zendev.damsel.loc" minutesago=5 | top sourcetype`.

host="zendev.damsel.loc" minutesago=5 | top sourcetype Last 7 days

Your timerange was substituted based on your search string

✓ 537 matching events Save search

Timeline: + zoom in - zoom out Scale: linear log

3 results in the last 7 days (from 9:57:09 PM to 10:02:09 PM on Saturday, October 3, 2009)

Options... Results per page

Overlay: None

	sourcetype	count	percent
1	linux_audit	271	50.465549
2	linux_secure	265	49.348231
3	cron-too_small	1	0.186220

Note

Take special note of the names in the sourcetype column and the names of the count and percent columns. These will be used to construct the names of the datapoints within our Splunk data source.

- Setup a Resource Manager monitoring template just as described in the simple search example.
- Add a Splunk type data source named sourcetype to the template with the following settings.
 - Splunk Server: *Hostname or IP of your Splunk server*
 - Splunk Port: 8089
 - Splunk Username: *Splunk username* (default is admin)
 - Splunk Password: *Splunk password* (default is changeme)
 - Search: host="{here/id}" minutesago=5 | top sourcetype
- Add data points to the sourcetype data source with the following names. These names come from concatenating the data in the first column of each row with the name of the column name with the target numeric data.
 - linux_audit_count
 - linux_audit_percent
 - linux_secure_count
 - linux_secure_percent

5. Create a graph that will show these results within Resource Manager in a useful way.
 - a. Add a graph from the Graph Definitions area of the monitoring template.
 - b. Set the ID to Splunk - Logs by Source Type then click **Submit**.
 - c. Set the Units to percent.
 - d. Set the Min Y to 0.
 - e. Set the Max Y to 100.
 - f. Click Save.
 - g. Select Manage Graph Points from the Action menu in the Graph Definitions area.

The Manage Graph Points dialog appears.

- h. Select Data Point from the Add menu.

The Add Data Point dialog appears.

- i. Use SHIFT-click or CTRL-click to select the following data points from the list then click **Submit**.
 - `sourcetype_linux_audit_percent`
 - `sourcetype_linux_secure_percent`
- j. Click into each of the graph points you just added to the graph and set the following properties.
 - Line Type: `Area`
 - Stacked: `True`
 - Format: `%5.1lf%%`
 - Legend: Audit or Secure respectively.

6. Bind the monitoring template to the `/Server/Linux` device class just as in the simple search example.

You will now have a graph for all Linux devices that shows what percentage of logs are coming from the audit and secure logs respectively. This ability to track multiple results from a single Splunk search has many other possible uses. Experiment with the top filter in Splunk to see what other useful data you could extract.

53.5. Daemons

Type	Name
Performance Collector	zencommand

Table 53.2. Splunk Monitoring Daemons

Chapter 54. SSH Monitoring Example

54.1. About

The LinuxMonitor ZenPack demonstrates the new Secure Shell (SSH) features. This example ZenPack includes functionality to model and monitor several types of device components for devices placed in the `/Server/SSH/Linux` device class by running commands and parsing the output. Parsing of command output is performed on the Resource Manager server or on a distributed collector. The account used to monitor the device does not require root access or special privileges.

This ZenPack is provided for developers as it provides some examples of how to create SSH performance collecting plugins. See the *Resource Manager Developer's Guide* for more information about additional SSH features.

54.2. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss Version 2.4 or higher
Required ZenPacks	ZenPacks.zenoss.LinuxMonitor

Table 54.1. Linux SSH Monitoring Example Prerequisites

54.3. Set Linux Server Monitoring Credentials

All Linux servers must have a device entry in an organizer below the `/Devices/Server/SSH/Linux` device class.

Tip

The SSH monitoring feature will attempt to use key-based authentication before using a configuration properties password value.

1. Select Infrastructure from the navigation bar.
2. Click the device name in the device list.

The device overview page appears.

3. Select Configuration Properties from the left panel.
4. Verify the credentials for the service account.

Name	Description
zCommandUsername	Linux user with privileges to gather performance information.
zCommandPassword	Password for the Linux user.

Table 54.2. Linux Configuration Properties

54.4. Add a Linux Server

The following procedure assumes that credentials have been set.

1. Select Infrastructure from the navigation bar.
2. Select Add a Single Device from the Add Device list of options.

The Add a Single Device dialog appears.

3. Enter the following information in the dialog:

Name	Description
Name or IP	Linux host to model.
Device Class	/Server/SSH/Linux
Model Device	Select this option unless adding a device with a user name and password different than found in the device class. If you do not select this option, then you must add the credentials (see Section 54.3, "Set Linux Server Monitoring Credentials") and then manually model the device.

Table 54.3. Adding Linux Device Details

4. Click **Add**.

54.5. Daemons

Type	Name
Modeler	zenmodeler
Performance Collector	zencommand

Table 54.4. Daemons

Chapter 55. SQL Transactions

55.1. About

The ZenSQLTx ZenPack allows you to test the availability and performance of MySQL, Sybase and Microsoft SQL servers. It provides a SQL data source where user-defined SQL queries can be executed against a database.

55.2. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss 2.2 or higher
Required ZenPacks	ZenPacks.zenoss.ZenSQLTx
MySQL client	Each remote collector must have an installed MySQL client

Table 55.1. SQL Transaction Prerequisites

55.3. Enable SQL Server Monitoring

Ensure that your Microsoft SQL Server authentication mode is set to "SQL Server and Windows Authentication mode." For more information about this setting and how to change it, refer to:

<http://msdn.microsoft.com/en-us/library/ms188670.aspx>

1. Click the device in the device list.
2. Select Device under Monitoring Templates in the left panel.
3. Select Add Local Template from the Action menu.

The Add Local Template dialog appears.

4. Enter a name of the template, and then click **Submit**.
5. Click the newly created template in the left panel.
6. In the Data Sources area, click .
7. Enter a name for the data source, select `SQL` as the type, and then click **Submit**.
8. Double-click the newly created data source.

The Edit Data Source dialog appears.

9. Change options as needed.

Option	Description
Database Type	Enter <code>MS SQL</code>
Host Name	Set the host name on which the database is located. This field accepts a TALES expression, such as <code>\${here/id}</code> or <code>\${here/getManageIp}</code>
Port	Set the port on which the database server is listening. If you do not specify a port number, then the default port for the database is used.

Option	Description
Database Name	Specify the name of the database (required).
User	Specify a user name with permission to connect to the database and run queries.
Password	Specify the user password.
SQL Queries	Specify the SQL queries that this data source should execute. A summary of MS SQL syntax is available in the documentation accompanying the software.

Table 55.2. MS SQL Server Transactions Data Source Options

- Click Save to save your changes.

Resource Manager creates a data point that corresponds to the total query time in milliseconds.

- Click **Test** to verify that the database connection can be completed, and that the data returned from the queries are correct.

See the Administration Guide for more information about setting up thresholds and graphs. To create data points that store the results of queries, see the section titled "Data Points."

55.4. Enable Sybase Server Monitoring

- Click the device in the device list.
- Select Device under Monitoring Templates in the left panel.
- Select Add Local Template from the Action menu.

The Add Local Template dialog appears.

- Enter a name of the template, and then click **Submit**.
- Click the newly created template in the left panel.
- In the Data Sources area, click .
- Enter a name for the data source, select `SQL` as the type, and then click **Submit**.
- Double-click the newly created data source.

The Edit Data Source dialog appears.

- Change options as needed.

Option	Description
Database Type	Enter <code>Sybase</code>
Host Name	Set the host name on which the database is located. This field accepts a TALES expression, such as <code>\${here/id}</code> or <code>\${here/getManageIp}</code>
Port	Set the port on which the database server is listening. If you do not specify a port number, then the default port for the database is used.
Database Name	Specify the name of the database (required).
User	Specify a user name with permission to connect to the database and run queries.

Option	Description
Password	Specify the user password.
SQL Queries	Specify the SQL queries that this data source should execute. A summary of Sybase syntax is available at the Sybase Manuals Web site.

Table 55.3. MySQL Server Transactions Data Source Options

- Click on the Save button to save your changes.

Resource Manager creates a data point that corresponds to the total query time in milliseconds.

- Click **Test** to verify that the database connection can be completed, and that the data returned from the queries are correct.

See the Administration Guide for more information about setting up thresholds and graphs. To create data points that store the results of queries, see the section titled "Data Points."

55.5. Enable MySQL Server Monitoring

- Click the device in the device list.
- Select Device under Monitoring Templates in the left panel.
- Select Add Local Template from the Action menu.

The Add Local Template dialog appears.

- Enter a name of the template, and then click **Submit**.
- Click the newly created template in the left panel.
- In the Data Sources area, click .
- Enter a name for the data source, select `SQL` as the type, and then click **Submit**.
- Double-click the newly created data source.

The Edit Data Source dialog appears.

- Change options as needed.

Option	Description
Database Type	Enter <code>MySQL</code>
Host Name	Set the host name on which the database is located. This field accepts a TALES expression, such as <code>\${here/id}</code> or <code>\${here/getManageIp}</code>
Port	Set the port on which the database server is listening. If you do not specify a port number, then the default port for the database is used.
Database Name	Specify the name of the database (required).
User	Specify a user name with permission to connect to the database and run queries.
Password	Specify the user password.
SQL Queries	Specify the SQL queries that this data source should execute. A summary of MySQL syntax is available at:

Option	Description
	http://dev.mysql.com/doc/refman/5.0/en/sql-syntax.html

Table 55.4. MySQL Server Transactions Data Source Options

10. Click on the Save button to save your changes.

Resource Manager creates a data point that corresponds to the total query time in milliseconds.

11. Click **Test** to verify that the database connection can be completed, and that the data returned from the queries are correct.

See *Resource Manager Administration* for more information about setting up thresholds and graphs. To create data points that store the results of queries, see the section titled "Data Points."

55.6. Storing Query Results

If any data is retrieved from the database that can be interpreted as a number, that number can be used as a data point. In select statements in which a column name is used, that column name becomes the name of the data point. In select statements in which no column name is specified (for example, aggregate functions such as `count(*)`, `sum()`, or `min()`), the data point name returned is database-dependent:

- MySQL - The column name can be controlled with an 'AS' clause in the query. If used, then the column name is the "cleaned up" result of the 'AS' clause; otherwise, it uses the format: 'q' + query number (beginning with 0) + '_' + column number in the query (beginning with 0).
- All other databases - The column name uses the format: 'q' + query number (beginning with 0) + '_' + column number in the query (beginning with 0).

Non-alphanumeric characters ([^za-zA-Z0-9_]) are removed from the column name to produce the data point name. Any query results that cannot be interpreted as a number are ignored, and the query numbers will not change.

For example, the queries:

```
select count(*) from Users;select UserName from Users; select count(*) * 4 from Users
```

return these results:

```
Queries completed successfully. | totalTime=2.13289260864 count=3.0 count4=12.0
```

Note

To use multiple queries (such as in the preceding example), they must be separated with a semicolon.

This example demonstrates multiple results from a single query:

```
select count(*) as count1, count(*)-1001 from history;
```

and returns these results:

```
Queries completed successfully. | totalTime=72.6099014282 count1=99894.0 count1001=98893.0
```

Notes:

- For SQL Server, use the format `q*_*` if no column name is found.
- The SQL 'as' renaming capability can be used to control the name of the data point.

55.7. Troubleshooting

To verify any queries, as well as any permissions or authentication issues, run the **zensql.py** command from the command line. Here's an example against the MySQL database on a Resource Manager server:

```
cd $ZENHOME/ZenPacks/*ZenSQLTx*/Z*/z*/Z*
./zensql.py -t mysql -H localhost -u zenoss -p zenoss -d events 'select \* from events.log;'
Queries completed successfully. | totalTime=54.5899868011
```

Note

Single quotes (') are required around the SQL statement. Any wild card characters (such as *) must be escaped, as shown in the previous example.

For the **zensql.py** command, the database types understood are shown in the following table.

Name	Database Type
mssql	MS SQL Server
sybase	Sybase
mysql	MySQL Server

Table 55.5. zensql.py Database Types

55.8. Daemons

Type	Name
Performance Collector	zencommand

Table 55.6. Daemons

Chapter 56. Storage Base

56.1. About

The StorageBase ZenPack contains base classes, and reports for ZenPacks that use those base classes.

The ZenPack includes these reports:

- **Licenses** - Shows the storage devices and installed licenses.
- **Clients** - Shows the devices that use the storage devices.
- **Disk Firmware** - After selecting a storage device, displays disk firmware information.

56.2. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss 3.0 or higher
Required ZenPacks	ZenPacks.zenoss.StorageBase, ZenPacks.zenoss.DynamicView

Table 56.1. Prerequisites

Chapter 57. Sugar CRM

57.1. About

The SugarCRMMonitor ZenPack allows you to monitor their Sugar CRM services.

57.2. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss 2.2 or higher
Required ZenPacks	ZenPacks.zenoss.SugarCRMMonitor

Table 57.1. Sugar CRM Prerequisites

57.3. Enable Monitoring

57.3.1. Configuring Resource Manager

All SugarCRM devices must exist under the `/Devices/Web/SugarCRM` device class.

1. Navigate to the device or device class under the `/Devices/Server/Tomcat` device class in the Resource Manager interface.
 - If applying changes to a device class:
 - a. Select the class in the devices hierarchy.
 - b. Click **Details**.
 - c. Select Configuration Properties.
 - If applying changes to a device:
 - a. Click the device in the device list.
 - b. Select Configuration Properties.
2. Edit the appropriate configuration properties for the device or devices.

Name	Description
zSugarCRMBase	
zSugarCRMPassword	Password for the <code>zSugarCRMUsername</code> user.
zSugarCRMTestAccount	
zSugarCRMUsername	Username allowed to log into the Sugar CRM server.

Table 57.2. SugarCRM Configuration Properties

3. Click Save to save your changes.
4. From the left panel, select Device under Monitoring Templates.
5. Select Bind Templates from the Action menu.

The Bind Templates dialog appears.

6. Move the SugarCRM template from the Available list to the Selected list.
7. Click **Save**.

The SugarCRM template should now be displayed under the Monitoring Templates for *Device*. You will now be able to start collecting the Sugar CRM metrics from this device.

8. Navigate to Graphs and you should see some placeholders for graphs. After approximately fifteen minutes you should see the graphs start to become populated with information.

57.4. Daemons

Type	Name
Performance Collector	zencommand

Table 57.3. Daemons

Chapter 58. vCloud Monitoring

58.1. About

VMware vCloud acts as a cloud layer on top of one or more vSphere virtual infrastructures. It allows for easy deployment of public or private clouds with required concepts, such as a self-service portal with built-in multi-tenancy. vCloud enables you to allocate your vSphere resources as desired to provide abstracted compute (CPU and memory) and storage resources to internal or external customers.

You can find more information about cloud computing and vCloud at the VMware site:

<http://www.vmware.com>

The vCloud ZenPack enables Resource Manager to use VMware's Cloud Director native management API to extend in-depth availability, performance, and event monitoring into the vCloud platform. If you provide the vCloud service, you can use the vCloud administrator perspective to gain a complete view of the entire cloud architecture. Or, as a vCloud consumer, you can use the user perspective to obtain organization-specific information.

58.2. Adding a Cell

A *cell* (also known as the cloud director or self-service portal) is the service to which Resource Manager connects to perform all discovery and monitoring. Follow these steps to use Resource Manager to discover the cloud and all available details:

1. From the Resource Manager user interface, select Infrastructure > Devices.

The device list appears.

2. Click  and then select Add vCloud Cell.

The Add vCloud Cell dialog appears.

Figure 58.1. Add vCloud Cell

3. Enter information in the dialog to add the vCloud cell:
 - **Hostname or IP Address** - Enter the host name or IP address for the cell.
 - **Port #** - Enter the cell port number.
 - **Username** - Enter the user name, in the form *username@organization*.

For example, if you are the cell administrator, enter `administrator@system`. Alternatively, if your user name is Joe and you are part of the ACME organization, enter `Joe@ACME`.

- **Password** - Enter the password for username.
4. Click **Add**.

A dialog appears with the option to view the job log of the cell being discovered. Select the option to view the job log and monitor the job's completion.

58.3. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss 3.0.x or higher
Required ZenPacks	ZenPacks.zenoss.vcloud

Table 58.1. vCloud Prerequisites

58.4. Monitoring

The `zenvcloud` daemon uses the Cloud Director API to perform a range of monitoring tasks. After your cell is added to Resource Manager, monitoring begins automatically.

58.5. Performance

Resource Manager collects these metrics directly from the cell for each vDC, irrespective of whether you have administrator or user credentials:

- CPU Limit, Allocated and Used
- Memory Limit, Allocated and Used
- Storage Limit, Allocated and Used

Resource Manager collects these metrics directly from the cell for each Provider vDC if you have administrator credentials:

- CPU Capacity, Allocation and Free
- Memory Capacity, Allocation and Free
- Storage Capacity, Allocation and Free

Chapter 59. VMware

Zenoss offers several options for collecting information from a VMware environment. The most complete solution uses VMware's vSphere API to retrieve information about hosts, virtual machines, clusters, resource pools, and data stores from a vCenter Server. VM migrations are tracked, and all performance data and events visible in the vSphere client are available. Zenoss highly recommends using this solution, described in section 1, "vSphere."

To track individual ESX hosts by using SNMP, see section 2, "VMware ESX via SNMP." This solution models only hosts and virtual machines, and some performance metrics for hosts.

When lower-level, ESX-specific performance data is needed, Zenoss can collect information by using the `esxtop` command, as described in section 3, "VMware esxtop." You can use this solution singly or in concert with either of the other two solutions.

59.1. vSphere

Read this section for information about using the ZenVMware ZenPack to collect information from a vCenter Server.

59.1.1. About

The ZenVMware ZenPack lets you collect information to monitor your VMware infrastructure. By entering a single set of connection parameters, you allow Resource Manager to:

- Obtain the names and properties of various entities in your VMware infrastructure
- Monitor metrics collected by VMware
- Retrieve VMware events

Resource Manager extracts VMware information through the VMware Infrastructure (VI) SDK, VMware's SOAP interface to its line of server virtualization products. The SDK can be accessed from an individual ESX server or vCenter Server (previously, VirtualCenter Server) instance, which can return information about many ESX servers.

For more information about VMware infrastructure, see VMware's Introduction to VMware Infrastructure

59.1.1.1. VMware Events

VMware records a wide range of events that are available through the VI SDK. Resource Manager extracts these events and makes them available in the event console.

Figure 59.1. VMware Events (Event Console)

The device column shows the ID of the VMware entity with which the event is associated, unless the event is specific to a guest VM. In that case, the Device column shows the ID of the host, and the Component column displays the ID of the guest.

Resource Manager maps the VMware event to the event class and assigns the event a severity level. The event class appears in the Event Class column.

To see detailed event information and the original VMware event type, double-click the event row.

The VMware event type is the value shown for eventGroup.

Figure 59.2. Event Details

59.1.1.1.1. Migration Events

When a VMotion guest migrates from one host to another, VMware records events to signal its progress. When a VmMigrated event occurs, it is duplicated to become two events, which are mapped to the `/VMware/Migration` event class in Resource Manager. One event contains the originating host as the device; the other lists the destination host as the device.

An event command (navigate to Events > Event Manager, and then select Commands in the left panel) reacts to these events by remodeling the two hosts and generating an updated view of the guests. The time required to produce updated guest lists (from the time migration completes) is between 30 seconds and four minutes.

59.1.2. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss 3.0 or higher
Required ZenPacks	ZenPacks.zenoss.ZenVMware ZenPacks.zenoss.StorageBase ZenPacks.zenoss.DynamicView
VMware VI API	Compatible with VMware Infrastructure 3 (including ESX Server 3.5, VirtualCenter Server 2.5, and ESX Server 3i) and vSphere 4 and 5 (including ESX 4, ESXi 4 and 5, vCenter Server 4 and 5). It is not explicitly compatible with ESX Server 3.0.x or VirtualCenter Server 2.0.x, or any previous versions.

Table 59.1. Prerequisites

Warning

If the time on the monitored VC/ESX server is too far from the time on the box where the `zenvmwareperf` daemon is running, the daemon will not collect any data.

59.1.3. Enable Monitoring

Follow these steps to begin monitoring your VMware servers.

1. From Infrastructure > Devices, select Add VMware Infrastructure from .

The Add VMware dialog appears.

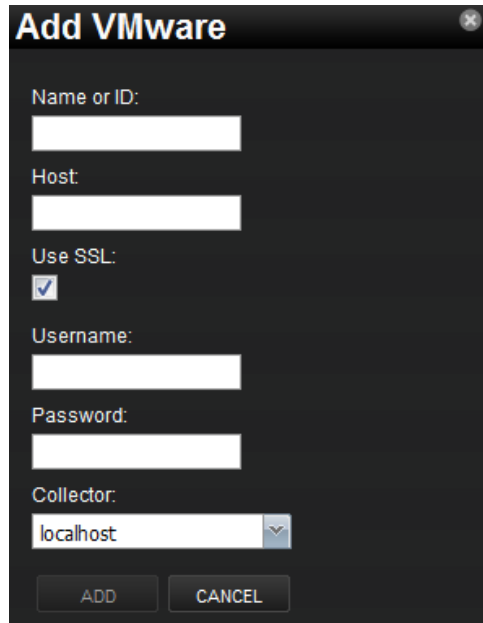

Figure 59.3. Add VMware Infrastructure Dialog

2. Enter parameters to connect to the ESX server or vCenter Server that will provide monitoring capabilities.
 - **Name or ID** - Enter a name for the infrastructure to be monitored.
 - **Host** - Enter the hostname of the server providing the VI SDK connections. This can be an individual ESX server or the location of a vCenter Server instance.
 - **Use SSL** - Select this option if the connection should be made by using SSL encryption.
 - **Username** - Enter the user name used to authenticate.
 - **Password** - Enter the password used to authenticate.
 - **Collector** - Select the collector to use to retrieve information from the VI SDK endpoint.
3. Click Add.

Resource Manager begins modeling the VMware infrastructure. It places the information in the device hierarchy under `/Devices/VMware/ID`, where ID is the value of the ID field you entered during setup.

59.1.4. Viewing VMware Devices

Resource Manager represents these VMware entities as devices:

- Hosts (ESX servers)
- Resource Pools
- Data stores
- Clusters

Each of these categories is represented as a device class under the newly created organizer. For example, if the ID of an infrastructure is `esxwin`, then four device classes appear below `/Devices/VMware/esxwin`: Clusters, Datastores, Hosts, and ResourcePools.

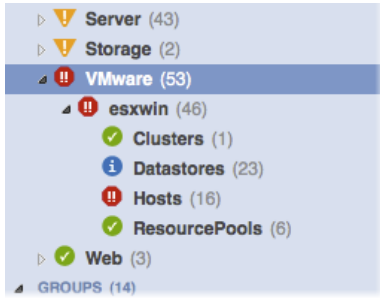

Figure 59.4. VMware Device Classes

If the SDK endpoint is an individual ESX server, then the Clusters organizer will be empty. (A VMware cluster is a concept external to an individual host.)

59.1.5. Viewing Guest Virtual Machines

To view guest VMs on an ESX server:

1. Navigate to a device in the Hosts class.
2. Select VMware Guest in the host's component tree (in the left panel).

The Virtual Guest Devices list appears.

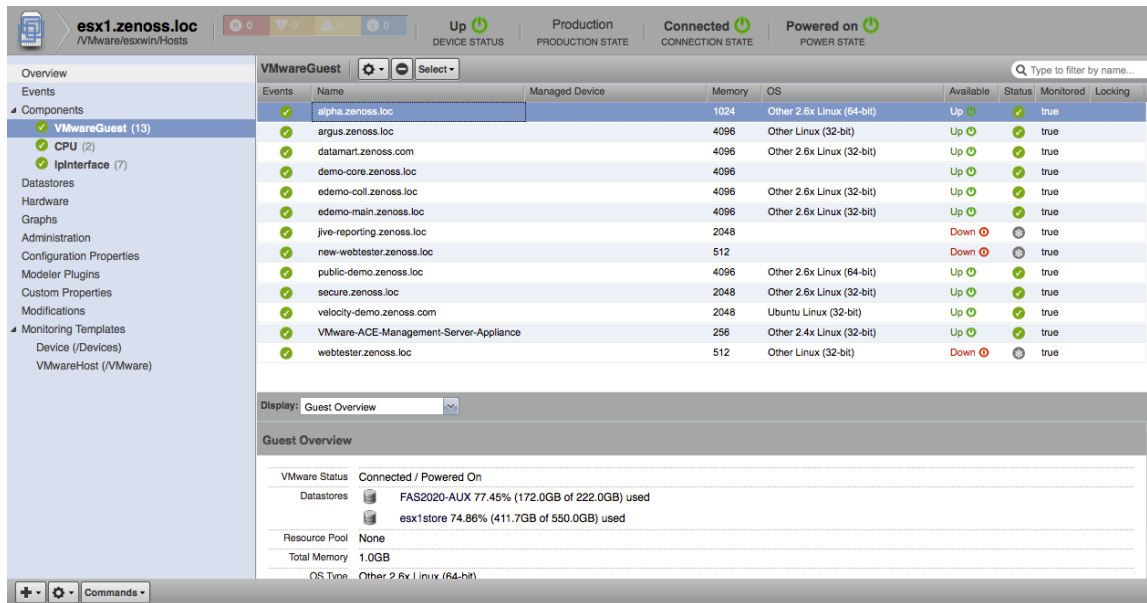

Figure 59.5. Virtual Guest Devices

In the list, the first column contains a link to the guest component, named the same name as the VM. (This is not necessarily the same as the VM hostname.) If the VM has been modeled elsewhere in Resource Manager, then a link to that device appears in the Managed Device column.

As shown in the previous figure, none of the VMs are being monitored in their "native" device classes. For example, the guest named "Idap test box" is a Linux VM with the hostname "public-demo.zenoss.loc." If you add that device to /Devices/Server/Linux, a link will appear.

Events	Name	Managed Device	Memory	OS	Available	Status	Monitored	Locking

Figure 59.6. Virtual Guest Devices - Managed Device

Click the Name link to go to the Guest component status page, which shows the VM's relationships to other VMware entities, and provides access to VMware-specific metrics and events.

Click the managed device link to go to the Device status page, which contains information about the device as a separate Linux or Windows server. These two status pages link to each other.

59.1.6. Enabling Data Collection Using resxtop

Follow these steps to enable gathering of VMware host and guest statistics.

59.1.6.1. Gathering VMware Host Statistics

By default, data collection using `resxtop` statistics is disabled. To enable it:

1. From the Resource Manager interface, select Advanced, and then select Monitoring Templates.
2. Locate and select the `VMwareHost_esxtop` template.
3. For each of the data sources:
 - a. Click the data source to open it.
 - b. Select the Enabled option to enable data collection.
 - c. Click **Save**.

Data collection will begin shortly after update, followed by visible graph data.

For information about the collected data, see Section 7, "Batch Mode," in the document titled "Interpreting esxtop Statistics" at the following location:

<http://communities.vmware.com/docs/DOC-9279>

59.1.6.2. Gathering VMware Guest Statistics

By default, data collection using `resxtop` statistics is disabled. To enable it:

1. From the Resource Manager interface, select Advanced, and then select Monitoring Templates.
2. Locate and select the `VMwareGuest_esxtop` template.
3. For each of the data sources:
 - a. Click the data source to open it.
 - b. Select the Enabled option to enable data collection.
 - c. Click **Save**.

Data collection will begin shortly after update, followed by visible graph data.

For information about the collected data, see Section 7, "Batch Mode," in the document titled "Interpreting esxtop Statistics" at the following location:

<http://communities.vmware.com/docs/DOC-9279>

59.1.7. Adding a Custom Metric

In Resource Manager, metric-bearing VMware entities (such as Hosts, Guests, and Clusters) have associated templates. These templates define which metrics are gathered. By default, only a subset is collected; however, you can add more by adding data sources to the templates. Once created, you can then create custom graphs from these data sources.

To create a custom data source:

1. Navigate to Advanced > Monitoring Templates and select the template to which you want to add the data source.

2. From the Data Sources area, click  to add a data source.

The Add Data Source dialog appears.

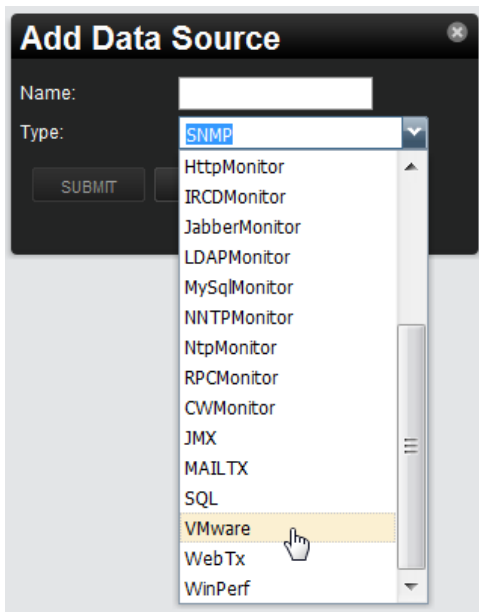

Figure 59.7. Add Data Source

3. Enter a name and select the `VMware` data source from the list of options, and then click **Submit**.
4. Double-click the newly created data source to edit it. Enter or select values:
 - **Event Key** - Not used.
 - **Severity** - Not used.
 - **Group, Counter, and Rollup Type** - VMware-specific data points are determined by this trio of strings. For information about each of these metrics, see the chapter titled "Performance Counters Reference" in the VI SDK Programming Guide.
 - **Instance** - Certain metrics are further specified by an instance name. For example, the metric whose Group/Counter/Rollup Type triplet is Network/Network Data Receive Rate/average requires the name of the actual

interface for full specification. In Resource Manager, this metric is represented by the data source `nicRx` on the template `VMwareNic`. The `VMwareNic` template is bound to the individual host interfaces, each of whose ID is the interface name. In this case, the instance name is `$(here/instanceId)`.

- Click **Save** to save the new data source.

59.1.8. Moving VMware Devices Between Collectors

If you move a VMware device to a different collector, you must follow one of these procedures to force the changes to take effect:

- Restart the collector daemons. To do this, go to **Advanced > Settings**, select **Daemons** in the left panel, and then click **Restart** in the row for each of these daemons:
 - `zenvmwaremodeler`
 - `zenvmwareperf`
 - `zenvmwareevents`

Note

Alternatively, as user `zenoss`, enter the following commands to stop and then restart these Resource Manager daemons:

```
zenvmwaremodeler restart
zenvmwareperf restart
zenvmwareevents restart
```

OR

- Navigate to the page for the organizer that represents the VMware endpoint (for example, `Devices/VMware`, `myEndpoint`), and then select **Push Changes** from the Action menu.

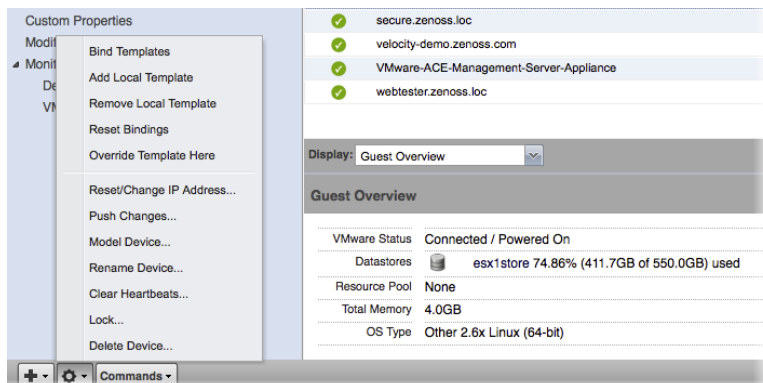

Figure 59.8. Push Changes

59.1.9. Daemons

Type	Name
Modeler	<code>zenvmwaremodeler</code>
Performance Collector	<code>zenvmwareperf</code>
Event Collector	<code>zenvmwareevents</code>

Table 59.2. Daemons

59.1.9.1. Tuning Options

These collector daemons offer options for tuning performance. Use them to control data amounts and the rate at which data comes back to be modified.

- `zenvmwareperf`

Option	Description
<code>--callChunkSize= <i>Value</i></code>	Specifies the number of performance requests to submit at the same time.
<code>--callChunkSleep= <i>Value</i></code>	Specifies the time to sleep, in seconds, between performance requests.

Table 59.3. Daemons

- `zenvmwareevents`

Option	Description
<code>--eventChunkSize= <i>Value</i></code>	Specifies the number of events to gather at one time.
<code>--eventChunkSleep= <i>Value</i></code>	Specifies the time to sleep, in seconds, between event requests.

Table 59.4. Daemons

59.2. VMware ESX via SNMP

Read this section for information about using the VMwareESXMonitor ZenPack to track individual ESX hosts via SNMP.

59.2.1. About

The VMwareESXMonitor ZenPack allows you to monitor VMware ESX hosts and their guests. This ZenPack:

- Extends ZenModeler to discover guests running on the ESX host.
- Provides screens and templates for collecting and displaying resources allocated to the guests.

This ZenPack requires the ZenossVirtualHostMonitor ZenPack be installed as a prerequisite.

59.2.2. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss 2.2 or higher
Required ZenPacks	ZenPacks.zenoss.VMwareESXMonitor, ZenPacks.zenoss.ZenossVirtualHostMonitor

Table 59.5. Prerequisites

59.2.3. Monitoring VMware ESX Servers

To monitor VMware ESX servers:

1. Make sure you have SNMP connectivity to your ESX 3 servers.
2. Create your ESX services using the /Servers/Virtual Hosts/ESX device class.

Note

If you have already modeled these servers, then remove and recreate them under the ESX device class. Do not move them.

3. Select the Guest menu and ensure that the guest hosts were found when the devices were added.
4. Using the VMware vSphere client, add Resource Manager to the list of destinations for SNMP traps. (See Administration > vCenterServerSettings > SNMP.) For information about configuring traps for a stand-alone ESX 3 server, see "About SNMP and VMware Infrastructure" at:

http://www.vmware.com/pdf/vi3_35/esx_3/r35u2/vi3_35_25_u2_admin_guide.pdf

Notes:

- There is a link to the VMware Web interface on each ESX server Status page.
- If the name of the Guest under ESX is the same as the name of a device being monitored directly by Resource Manager, a link is provided to take you directly to that device from the Guest list.

59.2.4. Enabling SNMP Subagents

ESX servers (Version 4.x and higher) contain an SNMP subagent from VMware. This subagent provides all information related to VMware (such as virtual machines and their status). By default, the subagent is disabled.

The VMware SNMP subagent does not provide information about the ESX server itself (such as processes, memory, CPU, or performance data).

Note

The VMware SNMP subagent cannot share port 161. If any other agent is using that port (usually the NET-SNMP agent), the subagent cannot start.

To fully monitor the ESX machine on your Resource Manager server, you must enable both SNMP agents (NET-SNMP and the VMware subagent). Follow these steps to enable both agents using an SNMP proxy:

1. Stop the snmpd service through the service console (via SSH) on the ESX host:

```
service snmpd stop
```

2. Add a proxy line to the `/etc/snmp/snmpd.conf` file:

```
proxy -v 1 -c public udp:127.0.0.1:171 .1.3.6.1.4.1.6876
```

This line will use the snmpd service to access the VMware MIB on the subagent running at port 171.

3. Using the VMware vSphere CLI (command line interface), bind the VMware SNMP agent to port 171, and then enable the subagent by using these commands:

```
vicfg-snmp.pl --server <hostname|IP address> --username <username> --password <password> -c public --port 171
vicfg-snmp.pl --server <hostname|IP address> --username <username> --password <password> -E
```

4. Via SSH, go back to the ESX host. Restart the mgmt-vmware service (hostd) and the snmp service. On the ESX host from the service, enter:

```
service mgmt-vmware restart
service snmpd restart
```

59.2.5. Daemons

Type	Name
Modeler	zenmodeler
Performance Collector	zenperfsnmp

Table 59.6. Daemons

59.3. VMware esxtop

Read this section for information about using the EsxTop ZenPack to collect VMware-specific performance data.

59.3.1. About

The EsxTop ZenPack uses the `resxtop` command to gather performance information about VMware Infrastructure™ ESX™ servers. It can be used alone, or with one of the other VMware ZenPacks. When used alone, a basic modeler creates virtual machines under the `/Devices/Server/Virtual Hosts/EsxTop` device class for any host device that is added and modeled. Otherwise, performance data can be collected for the ESX hosts modeled by the other ZenPacks.

59.3.2. Prerequisites

To implement this ZenPack, you must:

- Install the OpenSSL development package, Version 0.9.7 or higher
- Install the VMware vSphere CLI (as described in the section titled Installing Prerequisite Libraries).
- Update the ZenossVirtualHostMonitor ZenPack to Version 2.3.5.

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss Version 3.0 or higher
Required ZenPacks	ZenPacks.zenoss.ZenossVirtualHostMonitor ZenPacks.zenoss.EsxTop
VMware vSphere™ Command-Line Interface (CLI)	VMware vSphere CLI Version 4.1 or higher must be installed on the Resource Manager collectors.

Table 59.7. Prerequisites

59.3.2.1. Installing Prerequisite Libraries

The VMware vSphere CLI is required for access to the `resxtop` command, which enables Resource Manager to model and gather performance information about individual ESX servers.

Follow these steps to install the CLI and required software:

1. If you have not yet installed it, install the OpenSSL development package. For example, for an RPM-based system, enter:

```
yum install openssl-devel
```

2. From your VMware account, download the VMware vSphere CLI.

Note

For downloads and documentation, go to:

<http://downloads.vmware.com/d/details/vcli41/ZHcqYmRoaCpiZHRAag==>

3. Copy the package to each Resource Manager collector.
4. For each collector:
 - a. Expand the package file.
 - b. Run the following command to install the package:

```
./vmware-install.pl
```

- c. As the zenoss user, run the following command to verify successful installation:

```
resxtop --server myESXServer --user userOnRemoteEsxServerAllowedToUseEsxTop -b -n 1 -a
```

The `resxtop` command prompts for a password.

- d. Enter the password for a user with permissions on the remote ESX server.

If the command is working correctly, then a screen displays with several pages of command output.

- e. Create a symbolic link from the location that the `resxtop` command was installed into the `$ZENHOME/libexec` directory. This allows the `check_esxtop` command to automatically determine which binary to run. For example:

```
cd $ZENHOME/libexec
ln -s PathToResxtop
```

- f. Test the `check_esxtop` command by showing the VMs on the remote server:

```
$ZENHOME/ZenPacks/Ze*EsxTop*/Z*/z*/E*/libexec/check_esxtop --server=myEsxserver \
--user=userOnRemoteEsxServerAllowedToUseEsxTop --password=password --showvms
```

59.3.3. Enabling the ZenPack

Follow these steps to set up the EsxTop ZenPack. From the Resource Manager interface, add a host:

1. From Infrastructure > Devices, navigate to the `/Devices/Server/Virtual Hosts/EsxTop` device class.
2. From , select Add a Single Device.

The Add a Single Device dialog appears.

3. Enter a host name or IP address.
4. De-select the Model Device option.
5. Click **Add**.
6. Select the newly added device in the list.

The device overview appears.

7. Click **Details**, and then select Configuration Properties in the left panel.
8. Enter login credentials for the `zCommandUsername` and `zCommandPassword` configuration properties, and then click **Save**.
9. If the device has an SNMP agent installed, update the ESX device configuration with the appropriate SNMP configuration information, and then add any desired modeler plugins.

10. From  (Action menu), select Model device.

59.3.4. Daemons

Type	Name
Modeler	zenmodeler
Performance Collector	zencommand

Table 59.8. Daemons

Chapter 60. Web Page Response Time (HTTP)

60.1. About

ZenPacks.zenoss.HttpMonitor monitors connection response time to an HTTP server and determines whether specific content exists on a Web page.

60.2. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss Version 2.2 or higher
Required ZenPacks	ZenPacks.zenoss.HttpMonitor

Table 60.1. HTTP Prerequisites

60.3. Enable Monitoring

Follow these steps to enable monitoring:

1. Select Infrastructure from the navigation bar.
2. Click the device name in the device list.

The device overview page appears.

3. Expand Monitoring Templates, and then select Device from the left panel.
4. Select Bind Templates from the Action menu.

The Bind Templates dialog appears.

5. Add the HttpMonitor template to the list of selected templates, and then click **Submit**.

Note

Prior to Zenoss 2.4, this template was not available. If your Zenoss release is prior to Zenoss 2.4 you must create the template, data source and graphs manually. See *Zenoss Administration* for more details on these steps.

6. The HttpMonitor template is added to the list of monitoring templates. You can now begin collecting Web server metrics from the device.

60.4. Check for a Specific URL or Specify Security Settings

1. Select Infrastructure from the navigation bar.
2. Click the device name in the device list.

The device overview page appears.

3. Expand Monitoring Templates, and then select Device from the left panel.
4. Create a local copy of the template.
5. Select the newly created local template copy.
6. Select the HttpMonitor data source, and then select View and Edit Details from the Action menu.

The Edit Data Source dialog appears.

7. Change data source options as needed, and then click **Save**.

Option	Description
Port	The port to connect to HTTP server (default 80).
Use SSL	Use SSL for the connection
Url	Address of the web page.
Basic Auth User	If the website requires credentials, specify the username here.
Basic Auth Password	Password for the user.
Redirect Behavior	If the web site returns an HTTP redirect, should the probe follow the redirect or create an event? Possible event severities are OK, Warning, and Critical.

Table 60.2. HTTPMonitor Content Checking Data Source Options

60.5. Check for Specific Content on the Web Page

This procedure allows Resource Manager to create an event if content at the web page does not match the expected output.

1. Select Infrastructure from the navigation bar.
2. Click the device name in the device list.

The device overview page appears.

3. Expand Monitoring Templates, and then select Device from the left panel.
4. Create a local copy of the template.
5. Select the newly created local template copy.
6. Select the HttpMonitor data source, and then select View and Edit Details from the Action menu.

The Edit Data Source dialog appears.

7. Change data source options as needed, and then click **Save**.

Option	Description
Regular Expression	A Python regular expression to match text in the web page.
Case Sensitive	Is the regular expression case-sensitive or not?
Invert Expression	If you would like to test to see if the web page does not contain content matched by a regular expression, check this box.

Table 60.3. HTTPMonitor Content Checking Data Source Options

60.6. Tuning for Site Responsiveness

1. Select Infrastructure from the navigation bar.
2. Click the device name in the device list.

The device overview page appears.

3. Expand Monitoring Templates, and then select Device from the left panel.

4. Create a local copy of the template.
5. Select the newly created local template copy.
6. Select the HttpMonitor data source, and then select View and Edit Details from the Action menu.

The Edit Data Source dialog appears.

7. Change data source options as needed, and then click **Save**.

Option	Description
Timeout (seconds)	Seconds before connection times out (default: 60)
Cycle Time (seconds)	Number of seconds between collection cycles (default: 300 or five minutes)

Table 60.4. HTTPMonitor Tunables Data Source Options

60.7. Daemons

Type	Name
Performance Collector	zencommand

Table 60.5. Daemons

Chapter 61. WebSphere Application Server

61.1. About

The WebSphere monitoring feature allows Resource Manager to monitor IBM WebSphere Application Servers (WAS).

61.2. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss 2.2 or higher
Required ZenPacks	ZenPacks.zenoss.ZenWebTx 2.5 or higher, ZenPacks.zenoss.WebsphereMonitor

Table 61.1. WebSphere Prerequisites

61.3. Enable Monitoring

61.3.1. Configure WAS for Monitoring

To successfully monitor WebSphere, you must have the Performance Monitoring Infrastructure (PMI) servlet installed and enabled on your WebSphere instance. For more information, please see the IBM WebSphere documentation.

61.3.2. Configure Resource Manager

1. Navigate to the device or device class under the `/Devices/Server/Tomcat` device class in the Resource Manager interface.
 - If applying changes to a device class:
 - a. Select the class in the devices hierarchy.
 - b. Click **Details**.
 - c. Select Configuration Properties.
 - If applying changes to a device:
 - a. Click the device in the device list.
 - b. Select Configuration Properties.
2. Edit the appropriate configuration properties for the device or devices.

Property	Description
<code>zWebsphereURLPath</code>	Path to the PMI servlet on a WebSphere instance. The default value is the default path on a WebSphere installation: <code>wasPerTool/servlet/perfservlet</code>
<code>zWebsphereUser</code>	Used for HTTP basic authentication. This field is not required, and is empty by default.

Property	Description
zWebspherePassword	Used for HTTP basic authentication. This field is not required, and is empty by default.
zWebsphereAuthRealm	Used for HTTP basic authentication. This field is not required, and is empty by default.
zWebsphereServer	Used by the provided template to build the xpath queries for the data to collect. You must supply a value for this field. There is no default value.
zWebsphereNode	Used by the provided template to build the queries for the data to collect. You must supply a value for this field.

Table 61.2. WebSphere Configuration Properties

- Click Save to save your changes.
- Select Device under Monitoring Templates in the left panel.
- From the Action menu, select Bind Templates.

The Bind Templates dialog appears.

- Move the Websphere template from the Available list to the Selected list, and then click **Save**.

The Websphere template should now be displayed under the Monitoring Templates for *Device*. You will now be able to start collecting the WebSphere metrics from this device.

- Navigate to Graphs and you should see some place holders for graphs. After approximately 15 minutes you should see the graphs start to become populated with information.

61.4. Examples

Once the PMI module has been installed into WAS, you can generate the PMI XML file. You then can use this file to complete the monitoring template.

This example shows how to obtain the configuration properties required for basic monitoring functionality. It further shows how to add other metrics to be monitored.

You can generate the PMI XML file by browsing to this URL:

`http://WASserver/wasPerfTool/servlet/perfservlet`

Note

This is the default WAS server location. The URL should match the configuration property setting used in the template.

where *WASserver* is the WAS server's host name or IP address.

The following example XML file results:

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE PerformanceMonitor SYSTEM "/wasPerfTool/dtd/performancemonitor.dtd">
<PerformanceMonitor responseStatus="success" version="6.1.0.21">
  <Node name="serverA">
    <Server name="serverAB">
      <Stat name="serverABC">
        ...
      <Stat name="Dynamic Caching">
```

```

        <Stat name="Object: ws/WSecureMap">
          <Stat name="Object Cache">
            <Stat name="Counters">
              <CountStatistic ID="21" count="0" lastSampleTime="1242827146039" name="HitsInMemoryCount" \
                startTime="1242827146039" unit="N/A"/>
              <CountStatistic ID="28" count="5" lastSampleTime="1243610826245" name="MissCount" \
                startTime="1242827146039" unit="N/A"/>
            </Stat>
          </Stat>
        </Stat>
      </Stat>
    </Server>
  </Node>
</PerformanceMonitor>

```

In the previous example, configuration properties settings are:

- zWebsphereNode: serverA
- zWebsphereServer: serverAB

You might want to add counters beyond the standard counters. For example, you might want to add the HitsInMemoryCount and MissCount counters (related to dynamic caching). To do this, you would add the following twill commands to the Script tab of your WebSphere data source:

```

xpathextract HitsInMemoryCount '/PerformanceMonitor/Node[@name="{here/zWebsphereNode}"]/\
Server[@name="{here/zWebsphereServer}"]/Stat[@name="server"]/Stat[@name="Dynamic Caching"]/\
Stat[@name="Object: ws/WSecureMap"]/Stat[@name="Object Cache"]/Stat[@name="Counters"]/\
CountStatistic[@name="HitsInMemoryCount"]/attribute::count' xpathextract MissCount \
'/PerformanceMonitor/Node[@name="{here/zWebsphereNode}"]/Server[@name="{here/zWebsphereServer}"]/\
Stat[@name="server"]/Stat[@name="Dynamic Caching"]/Stat[@name="Object: ws/WSecureMap"]/\
Stat[@name="Object Cache"]/Stat[@name="Counters"]/CountStatistic[@name="MissCount"]/attribute::count'

```

After adding these commands, you would then add the data points for HitsInMemoryCount and MissCount, and then add the data points to a graph.

61.5. Daemons

Type	Name
Performance Collector	zenwebtx

Table 61.3. Daemons

Chapter 62. Xen Virtual Hosts

62.1. About

The XenMonitor ZenPack allows you to monitor Xen para-virtualized domains with Resource Manager.

This ZenPack:

- Extends ZenModeler to discover guests running on the Xen host.
- Provides screens and templates for collecting and displaying resources allocated to guests.

The XenMonitor ZenPack requires the ZenossVirtualHostMonitor ZenPack to be installed as a prerequisite.

62.2. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss Version 2.2 or higher
Required ZenPacks	ZenPacks.zenoss.XenMonitor ZenPacks.zenoss.ZenossVirtualHostMonitor

Table 62.1. Xen Virtual Hosts Prerequisites

62.3. Model Hosts and Guest

For each Xen server, follow this procedure:

1. Optionally, place an SSH key to your Xen server to allow the zenoss user from the Resource Manager server to log in as root without requiring further credentials.
2. Create the Xen server in the `/Servers/Virtual Hosts/Xen` device class.

Warning

If you have this server modeled already, remove the server and recreate it under the Xen device class. Do not move it.

3. Select the Guest menu and ensure that the guest hosts were found during the modeling process.

62.4. Daemons

Type	Name
Modeler	<code>zenmodeler</code>
Performance Collector	<code>zencommand</code>

Table 62.2. Daemons

Chapter 63. Web-Based Synthetic Transactions

63.1. About

The ZenWebTx ZenPack allows you to test the availability and performance of Web sites by performing some of the same activities performed by your user community. You create one or more tests that mimic user actions in a Web browser. Resource Manager then performs these tests periodically, creating events when a test fails or exceeds a time threshold.

Additionally, Resource Manager can record data for each test run, such as:

- Time required for the test to execute
- Time taken for any portion of the test to complete
- Values extracted from Web pages during the test

ZenWebTx uses a scripting language called Twill to describe the steps of a test. These steps include actions such as:

- Clicking a link
- Completing form fields
- Assertions, which check for the presence or absence of text on a page. In addition, you can extract data from the Web page and record the numeric values that are a part of these patterns
- Descriptions of data to collect during the test

You can write Twill commands manually. You also can use a Firefox add-on called TestGen4Web to record a browser session that ZenWebTx then translates into Twill commands. The **zenwebtx** daemon processes the Twill commands periodically, recording data and creating events as appropriate.

63.1.1. Data Points

Data produced by any Resource Manager data source are called data points. `webTx` data sources contain two default data points:

- **totalTime** – Number of seconds taken to complete the entire transaction.
- **success** – Returns 1 (success) or 0 (failure), depending on whether or not the transaction succeeded.

You can create other data points by using the `extract` and `printTimer` twill commands, which output data values when the twill commands are run. You must create new data points with the same name you used in those commands to bring that data into Resource Manager. For more information about the `extract` and `printTimer` twill commands, refer to the appendix titled Appendix A, *twill Commands Reference*.

ZenWebTx supports using XPath queries to extract data from XML documents. For more information about this feature, refer to the appendix in this guide titled Appendix A, *twill Commands Reference*.

63.1.2. Event Generation

There are several situations for which ZenWebTx will create events in Resource Manager. These events use the component and event class specified on the Data Source tab. These situations are:

- ZenWebTx is unable to retrieve a page during the transaction.
- One of the twill commands fails, such as finding text that does not exist or following a link that does not exist.
- The timeout (specified on the Data Source tab) is exceeded.
- A threshold defined for one of the data points in this data source is exceeded. Thresholds are defined in the monitoring template that contains the data source.

63.2. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss 2.2 or higher
Required ZenPacks	ZenPacks.zenoss.ZenWebTx

Table 63.1. Web Transactions Prerequisites

63.3. Enable Monitoring

To create a `WebTx` data source:

- From the data sources area, click  (Add Data Source).
- In the Create Data Source dialog, enter the name of the new data source, and then select the data source type `WebTx`.
- Click **Submit**.
- Select the data source to edit it. Enter information or make selections to specify how and when this data source's Web transactions are performed, and which data should be collected:

Option	Description
Name	Displays the name of the data source that you specified in the Create Data Source dialog. This name is used in thresholds and graph definitions to refer to the data collected by this data source.
Source Type	Set to <code>WebTx</code> , indicating that this is a synthetic Web transaction data source. You cannot edit this selection.
Enabled	Set to True (the default) to collect information from this data source. You may want to set this value to False to disable data sources when developing the data source, or when making changes to the Web application being tested.
Component	Any time the Web transaction fails, Resource Manager generates an event. Use this field to set the Component field of the generated event.
Event Class	Select the event class of the event generated by this data source. Normally, this is set to <code>/Status/Web</code> (according to the value set on the data source).
Timeout	Specify the number of seconds that <code>zenwebtx</code> will attempt to execute this data source's commands before it generates an error event.
Cycle Time	Specify the number of seconds that <code>zenwebtx</code> will wait between the start of one test run and the start of the next.
User Agent	Specify the text that <code>zenwebtx</code> will present to target Web sites to identify itself.

Table 63.2. WebTx Data Source Options

- Click **Save** to save the specified settings.
- Select Script. From here, you will specify the details of the transaction. Information here also helps you debug `twill` commands when setting up the data source.

Enter information or make selections:

Option	Description
Initial URL	<p>Specify the URL of the page where the transaction will start. This field frequently contains a TALES expression to refer to a device's ID or IP address, such as <code>http://\${dev/id}</code> or <code>http://\${dev/manageIp}</code>.</p> <p>For more information on TALES expressions, refer to the Appendix in the Administration Guide titled TALES Expressions.</p>
Initial User	Specify the user name for authentication.
Initial Password	Specify the user password for authentication.
Initial Authentication Realm	Specify the basic HTTP authentication realm.
TestDevice	Use this field to test and debug twill commands. Enter the ID of a device, and then click Test Twill Commands to execute the twill commands against the device. If you do not specify a device, then Resource Manager will select a device for you.
Upload Recording	<p>Upload a Web session recording generated by the Firefox TestGen4Web add-on. Enter or browse to the recording location.</p> <p>If you specify a file here, and then click Save, Resource Manager translates the file to twill commands and replaces the contents of the Twill Commands field with the newly translated commands.</p>
Twill Commands	<p>Specify the number of seconds that zenwebtx will wait between the start of one test run and the start of the next.</p> <p>Enter twill commands that Resource Manager will execute to produce values and events for the data source.</p> <p>If you select this action, then the current contents of the Twill Commands field is completely replaced. Resource Manager does not save the replaced information.</p> <p>See the Section 63.4, "Creating twill Commands" section for more information about twill commands.</p>

Table 63.3. WebTx Script Settings

Note

If you provide values for Initial User, Initial Password, and Initial Authentication Realm, Resource Manager will use these credentials before accessing the URL specified for Initial URL. All three (Initial User, Initial Password, and Initial Authentication Realm) must be present; otherwise, the values are ignored.

7. Click **Save** to save the data source.

63.4. Creating twill Commands

ZenWebTx uses a language called twill to specify the steps of a Web test. Each `WebTx` data source has a field that contains the twill commands that describe a Web transaction. You can create this list of twill commands manually, or you can record a session in a browser and use that as the basis for your data source.

Some twill commands specify an action, such as following a specific link on a page or entering data in a form field. Other twill commands specify a test, such as searching for specific text on a page or making sure the title does not contain specific text. The full range of available commands is described in the appendix Appendix A, *twill Commands Reference*.

63.4.1. Creating twill Commands from TestGen4Web

The TestGen4Web Firefox add-on allows you to record browser sessions. ZenWebTx can take these sessions and convert them to twill, creating a starting point for developing ZenWebTx data sources.

Follow these general steps to record and convert a TestGen4Web session:

1. From the TestGen4Web toolbar in Firefox, use the **Record** and **Stop** buttons to record a session.
2. Use the **Save** button in the toolbar to save the session to a file.
3. From the Script page of a ZenWebTx data source in Resource Manager, browse to and select your saved session.
4. Click **Save** to convert the TestGen4Web session to twill. The newly converted commands appear in the Twill Commands field on the page, replacing any previous twill commands in that area.

63.4.2. Creating twill Commands Manually

Even if you use TestGen4Web to initially create twill commands, you will frequently want to edit these commands manually to add data points or additional content checks. The Appendix A, *twill Commands Reference* describes in detail the commands that you can use. The Test Twill Commands button on the Script page is helpful when testing twill commands as you create or edit them.

You also can execute twill commands interactively by using the **twill-sh** program from the command line. This program lets you enter commands one at a time and then inspect the pages that come back.

Invoke twill-sh with:

```
> PYTHONPATH=$ZENHOME/Products/ZenWebTx/lib
$ZENHOME/Products/ZenWebTx/bin/twill-sh
```

Within twill-sh, use the help command to list available commands and see a command descriptions. Of particular interest are these commands:

- **showforms** – Lists the forms on the page and the fields within each.
- **showlinks** – Lists the links on the page.
- **show** – Lists the source HTML from the page.
- **exit** – Quits the twill-sh program.

Often the most convenient way to use twill-sh is to create a text file that contains your twill commands. You can then specify that file on the command line when you invoke twill-sh. This lets you analyze problems that occur.

Invoke twill-sh with a text file as such:

```
> PYTHONPATH=$ZENHOME/Products/ZenWebTx/lib
$ZENHOME/Products/ZenWebTx/bin/twill-sh -i myTwillCommands.txt
```

The `-i` option instructs `twill-sh` to stay in the `twill` shell rather than exiting when it finishes running the commands in the `myTwillCommands.txt` file.

63.5. Monitoring through Proxy Servers

ZenWebTx can access Web servers through HTTP proxy servers and non-authenticating HTTPS proxy servers.

To configure ZenWebTx to use a proxy, you must define the `http_proxy` and `https_proxy` environment variables.

1. Open the `~zenoss/.bashrc` file.
2. Add the following lines:

```
export http_proxy=http://Address:Port/
export https_proxy=http://Address:Port/
```

where *Address* is the address of your HTTP or HTTPS proxy server, and *Port* is the port on which your proxy server listens.

63.5.1. Example Proxy Setup

HTTP and HTTPS proxies frequently listen on port 3128. If your proxy server is "my.proxyserver.loc" and it uses port 3128, then add these two lines to the `~zenoss/.bashrc` file:

```
export http_proxy=http://my.proxyserver.loc:3128/
export https_proxy=http://my.proxyserver.loc:3128/
```

63.5.2. Testing the Proxy Setup

You can test the proxy setup by using the `twill-sh` tool. `twill-sh` is an interpreter shell for the `twill` scripting language, which is used to define `WebTx` data sources.

After setting up the proxy information in the `~zenoss/.bashrc` file, follow these steps to test your setup:

1. Make sure `http_proxy` and `https_proxy` are defined in your current shell:

```
$ source ~zenoss/.bashrc
```

2. Launch the `twill` shell:

```
PYTHONPATH=$PYTHONPATH:\
$ZENHOME/ZenPacks/ZenPacks.zenoss.ZenWebTx/ZenPacks/zenoss/ZenWebTx/lib:\
$ZENHOME/ZenPacks/ZenPacks.zenoss.ZenWebTx/ZenPacks/zenoss/ZenWebTx/bin/twill-sh
```

3. Try to retrieve a URL through HTTP or HTTPS. For example, to retrieve the Resource Manager home page, enter:

```
go http://www.zenoss.com
```

You should see a message similar to this:

```
current page: http://www.zenoss.com
```

If an error message appears, then your proxy may not be correctly configured in the `~zenoss/.bashrc` file.

4. Exit the `twill` shell:

```
exit
```

63.6. Daemons

Type	Name
Performance Collector	zenwebtx

Table 63.4. Daemons

Chapter 64. Windows Performance

64.1. About

ZenWinPerf is a ZenPack that allows performance monitoring of Windows servers without an intermediary Windows server doing the data collection. ZenWinPerf provides the `winPerf` Data Source, which uses a Windows performance counter rather than an SNMP OID to specify the value to collect.

For more information on Windows Management Instrumentation (WMI), please see this Microsoft Technet Article.

Name	Description
<code>zenwin</code>	Watches Windows services and reports on status.
<code>zeneventlog</code>	Watches Windows Event Log and generates events.
<code>zenwinperf</code>	Collects Perfmon performance data.
<code>zenmodeler</code>	This models Windows devices and has both SNMP and WMI support.

Table 64.1. Windows Monitoring Daemons

64.2. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss 2.3 or higher
Required ZenPacks	ZenPacks.zenoss.WinModelerPlugins, ZenPacks.zenoss.ZenWinPerf
Supported OS Versions	Windows XP, Windows 2000, Windows 2003, Windows Vista, Windows 2008

Table 64.2. Windows Performance Monitoring Prerequisites

64.3. Enable Monitoring

64.3.1. Defining Windows Credentials

A connection to a Windows device cannot be established without a valid set of credentials. The configuration properties `zWinUser` and `zWinPassword` can be set per device or for an entire device class.

Tip

The user needs to be a member of the local administrators or of the domain administrators group unless the steps in Section 64.8, "Configuring a Standalone Windows Device for a Non-Administrative Account" are followed.

To set these configuration properties:

1. Navigate to the device or device class in the Resource Manager interface.
 - If applying changes to a device class:
 - a. Select the class in the devices hierarchy.
 - b. Click **Details**.
 - c. Select Configuration Properties.
 - If applying changes to a device:

- a. Click the device in the device list.
 - b. Select Configuration Properties.
2. Edit appropriate configuration properties for the device or devices.

Name	Description
zWinUser	Windows user with privileges to gather performance information. Like all Windows credentials, the domain should be specified in the <code>zWinUser</code> entry. Use <code>.\username</code> for an account that is not in the domain but only on the local computer.
zWinPassword	Password for the above user.

Table 64.3. Windows Performance Configuration Properties

3. Click Save to save your changes.

64.3.2. Add Devices in Resource Manager

The ZenWinPerf ZenPack includes a `/Device/Server/Windows/WMI` class that has several new device templates bound. SNMP data collection is not used in this class.

To move a device to the `/Device/Server/Windows/WMI` class:

1. Select the device row in the devices list.
2. Drag the device to the class in the devices hierarchy.

64.4. Monitor Other Performance Counters

To create your own `WinPerf` data sources, follow these steps:

1. Navigate to either a new or an existing monitoring template and select New DataSource from the Data Sources table menu.
2. Enter a name for the data source, select WinPerf as the type and click OK.
3. Enter a Windows performance counter in the Perf Counter field. See Windows Perfmon counters for more details.
4. Click **Save**. Notice that a data point is created with the same name as the performance counter you selected.
5. If you wish you can test the counter by entering a device id in the Test Device field and clicking the Test button.

64.5. Testing Connections from Windows

This procedure verifies that the username/password combination are correct, and that there is no firewall blocking the connection.

1. Run the **wbentest** command.
2. Click on the Connect... button.
3. In the Namespace field, enter:

```
\\HOST\root\cimv2
```

4. Enter login information in the User and Password fields.
5. Click on the Query field.
6. Enter the following to return a dialog with a list of services on the device.

```
select * from win32_service
```

64.6. Testing Connections from Resource Manager

This procedure verifies that the username/password combination are correct, and that there is no firewall blocking the connection. Since this is done from the Resource Manager server, this test is a better approximation of how successful Resource Manager will be in connecting to the Windows device.

As the zenoss user on the Resource Manager server:

```
wmic -U 'user' //device 'select * from Win32_computerSystem'
```

The **wmic** command will then prompt you for the password.

Note

This procedure is only valid for Resource Manager or Zenoss 2.3 or greater.

64.7. Modify Registry Settings for Firewalls in Secure Environments

Note

This procedure is only applicable for environments with firewalls and so most users will not need this step.

DCOM dynamically allocates one port per process. You need to decide how many ports you want to allocate to DCOM processes, which is equivalent to the number of simultaneous DCOM processes through the firewall. You must open all of the UDP and TCP ports corresponding to the port numbers you choose. You also need to open TCP/UDP 135, which is used for RPC End Point Mapping, among other things. In addition, you must edit the registry to tell DCOM which ports you reserved. You do this with the `HKEY_LOCAL_MACHINES\Software\Microsoft\Rpc\Internet` registry key, which you will probably have to create.

To allow remote registry access for the performance data to be read, see Controlling remote Performance Monitor access to Windows NT servers.

The following table shows the registry settings to restrict DCOMs port range to 10 ports.

Registry Key	Type	Setting
Ports	REG_MULTI_SZ	Range of port. Can be multiple lines such as: 3001-3010 135
PortsInternetAvailable	REG_SZ	Y
UseInternetPorts	REG_SZ	Y

Table 64.4. Firewall and Registry Settings for DCOM

These registry settings must be established in addition to all firewall settings.

64.8. Configuring a Standalone Windows Device for a Non-Administrative Account

Monitoring Windows devices normally requires an account with administrator-level privileges. For the Resource Manager user who wants to use a non-administrative account, several additional configuration steps must be performed on each Windows device, or by using a Group Policy.

Resource Manager uses the Windows Management Instrumentation (WMI) feature to collect Event Log and Service information in the Core edition and modeling information when using the Enterprise edition. In the Enterprise edition, the remote Windows registry API also is used to collect low-level performance monitor ("PerfMon") statistics. Both of these Windows sub-systems use the Microsoft Remote Procedure Call (MS-RPC) interface to connect to the

Windows device and gather the appropriate information. MS-RPC handles the authentication on a per-packet or per-session basis, but ultimately the access granted is determined by the sub-systems involved with serving the remote procedure calls.

1. If the Windows firewall is in use, modify it to allow Remote Administration access. This will open the MS-RPC port and others as needed. Enter the following command at the command prompt:

```
netsh firewall set service RemoteAdmin enable
```

2. On Windows XP, Simple File Sharing must be disabled for machines that are not located within a Domain. When this feature is enabled it causes all incoming MS-RPC connections to use the built-in Guest account, rather than the account credentials specified in the incoming call. This option may be found by going to Control Panel, opening the Folder Options applet and then choosing the View tab. In the Advanced Settings list, navigate to the bottom until you see the Use simple file sharing (Recommended) option, and then disable it.

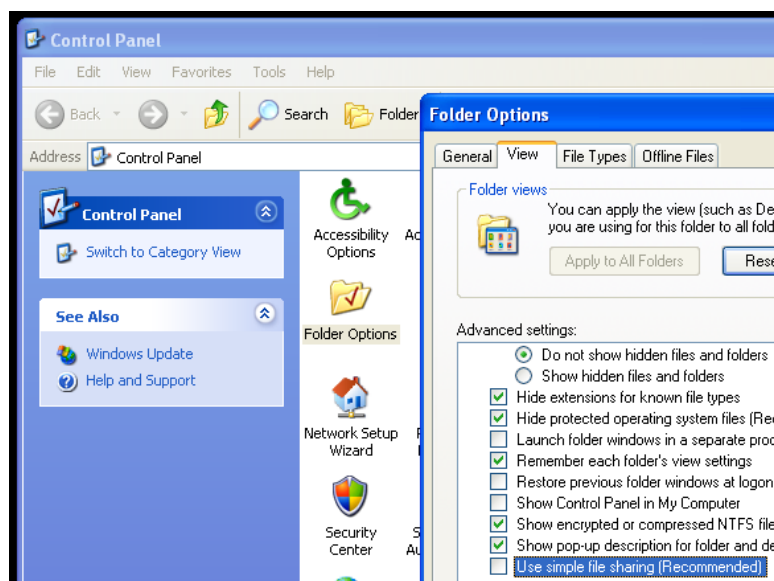

Figure 64.1. Windows XP Disable Simple File Sharing

3. Create a local account on the Windows device for monitoring. We assume in the remainder of these steps that this account was named `zenossmom` but any valid account name can be used. Place the account only in the Users group and not in the Power Users or Administrators groups. Optionally, create a new user group for monitoring and use that group instead of the account in the remaining steps.
4. Give the `zenossmom` account DCOM access by running the `dcomcnfg` utility.

Figure 64.2. Component Services COM Security Settings

- a. In the Component Services dialog box, expand Component Services, expand Computers, and then right-click My Computer and click Properties .
 - b. In the My Computer Properties dialog box, click the COM Security tab.
 - c. Under Access Permissions, click Edit Limits. In the Access Permission dialog box, add the `zenossmom` account to the list and ensure that the Remote Access checkbox is enabled, then click OK to close the dialog.
 - d. Under Launch and Activation Permissions, click Edit Limits. In the Access Permission dialog box, add the `zenossmom` account to the list and ensure that the Remote Launch and Remote Activation checkboxes are enabled, then click OK to close the dialog.
 - e. Click OK on the My Computer Properties dialog to save all changes.
5. Give the `zenossmom` account permissions to read the WMI namespace by using WMI Control.

Figure 64.3. WMI Control Properties

- a. Open the Start menu and right-click on My Computer. Select Manage from the menu.
 - b. In the Computer Management dialog, expand the Services and Applications item and then right-click on WMI Control.
 - c. In the WMI Control Properties dialog, click the Security tab.
 - d. Expand the Root namespace, select the CIMV2 namespace folder and then click Security.
 - e. In the Security for ROOT\CIMV2 dialog, add the `zenossmon` user to the list and ensure the Enable Account and Remote Enable checkboxes are enabled, then click OK to close the dialog.
 - f. In the WMI Control Properties dialog click OK to close the dialog and save all changes.
6. At this point in the process remote access to WMI should be enabled and functioning. Test it by running the following command from the Resource Manager server:

```
wmic -U '.\zenossmon' //myhostname 'SELECT Name FROM Win32_ComputerSystem'
```

If all is well this command should return the remote system name as the response. If there is any error, carefully recheck the above steps to ensure all access has been properly granted.

7. To gather Windows performance data from PerfMon permissions on the `winreg` registry key must be granted to our monitoring user by using **regedit**.

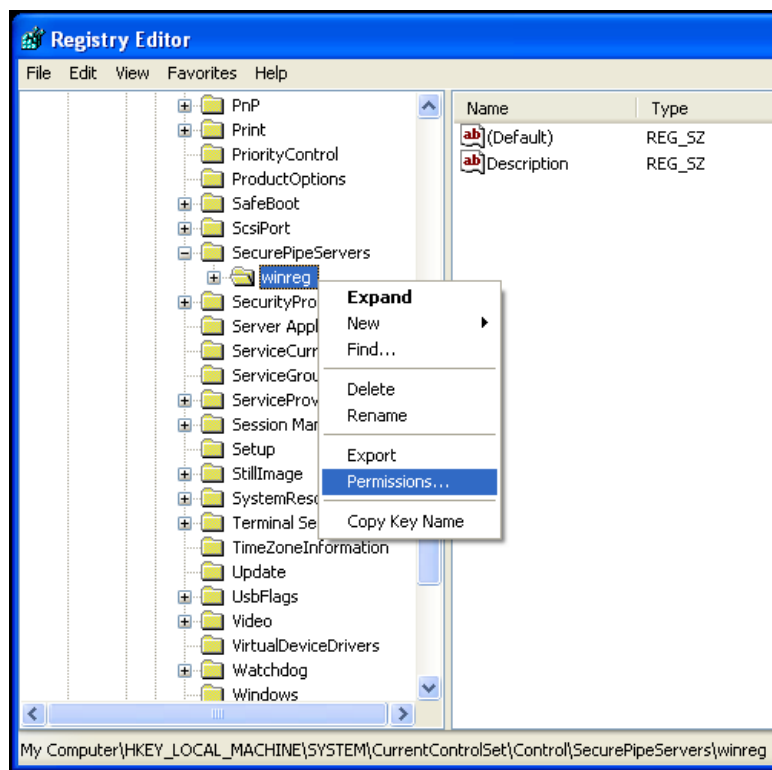

Figure 64.4. `regedit` and the `winreg` Key

- a. Run `regedit`.
 - b. Browse to the `HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\SecurePipeServers\winreg` key.
 - c. Right-click on the `winreg` key and choose Permissions.
 - d. Add the monitoring user to the permissions list and grant only `Read` permissions
8. Give the `zenossmom` account access to read the Windows Event Log.

Once the appropriate changes are made, test that Event Log access works with your `zenossmom` user. Run the following from your Resource Manager system:

```
wmic -U '.\zenossmom' //myhostname \
'SELECT Message FROM Win32_NTLogEvent WHERE LogFile="Application"'
```

9. If you are using SP1 or newer with Windows Server 2003, then you must allow non-administrative users to access the service control manager to monitor services.

At a command prompt, run the following:

```
sc sdset SCMANAGER
D:(A;;CCLCRPWC;;;AU)(A;;CCLCRPWC;;;SY)(A;;KA;;;BA)S:(AU;FA;KA;;;WD)
(AU;OIIOFA;GA;;;WD)
```

Warning

The above command should be one line.

At this point you should be able to query Windows service status remotely by using the non-administrative account. Test this by running the following command from your Resource Manager system:

```
wmic -U '.\zenossmom' //myhostname 'SELECT Name FROM Win32_Service'
```

64.9. Tuning Collector Daemon Performance

ZenWinPerf creates several configuration properties that control its behavior. Values for the configuration properties are initially set on the `/Devices` device class. As with any property, these values can be overridden in other device classes and on individual devices themselves.

Property	Setting
<code>zWinPerfCycleSeconds</code>	This is how frequently (in seconds) zewinperf data sources are collected. By default this is set to 300 seconds.

Table 64.5. *zenwinperf* Daemon Configuration Properties

64.10. Enabling the NTLMv2 Authentication Protocol

To enable the NTLMv2 authentication protocol for all Windows devices of a `zenwin`, `zenwinperf`, or `zenevent` log collector, update collector configuration files:

Alternatively, from the command line add:

```
--ntlmv2auth
```

```
# Enable NTLMv2 authentication for Windows
# Devices, default: False
#ntlmv2auth False
```

Chapter 65. ZenOperator Role

65.1. About

The ZenOperatorRole ZenPack creates a new role (`zenOperator`) suitable for use in Resource Manager. For more information about using this role, please see the *Resource Manager Administration Guide* section titled "Roles" in the chapter titled "Managing Users."

65.2. Prerequisites

Prerequisite	Restriction
Product	Resource Manager 4.x, Zenoss 2.2 or higher
Required ZenPacks	ZenPacks.zenoss.ZenOperatorRole

Table 65.1. Zen Operator Role Prerequisites

Appendix A. twill Commands Reference

A.1. About

twill is the language used by ZenWebTx to simulate user actions in a Web browser and to test pages retrieved by the simulation. The following sections list the twill commands available for use in ZenWebTx data sources.

Note

For detailed information about ZenWebTx, see the chapter titled Chapter 63, *Web-Based Synthetic Transactions*.

Some twill commands produce text output (see the section titled Section A.4, “Display”). These commands do not affect the execution of tests by ZenWebTx, and are useful in testing and debugging ZenWebTx data sources.

To see the output of commands that produce text output, click **Test Twill Commands** on the Script page of a ZenWebTx data source.

Twill commands are divided among the following categories:

- Browsing
- Assertions
- Display
- Forms
- Cookies
- Debugging
- Other commands

A.2. Browsing

- **go** <URL> - Visit the given URL.
- **back** - Return to the previous URL.
- **reload** - Reload the current URL.
- **follow** <link name> - Follow a link on the current page.

A.3. Assertions

- **code** <code> - Assert that the last page loaded had this HTTP status. For example, ``code 200`` asserts that the page loaded correctly.
- **find** <regexp> - Assert that the page contains this regular expression.
- **notfind** <regexp> - Assert that the page does not contain this regular expression.
- **url** <regexp> - Assert that the current URL matches the given regexp.
- **title** <regexp> - Assert that the title of this page matches this regular expression.

A.4. Display

- **echo** <string> - Echo the string to the screen.
- **redirect_output** <filename> - Append all Twill output to the given file.

- **reset_output** - Display all output to the screen.
- **save_html** [<filename>] - Save the current page's HTML to a file. If no filename is given, derive the filename from the URL.
- **show** - Show the current page's HTML.
- **showlinks** - Show all of the links on the current page.
- **showforms** - Show all of the forms on the current page.
- **showhistory** - Show the browser history.

A.5. Forms

- **submit** * [<n>]* - Click the nth submit button, if given; otherwise, submit via the last submission button clicked. If nothing is clicked, then use the first submit button on the form. See the section titled Details on Form Handling for more information.
- **formvalue** <formnum> <fieldname> <value> - Set the given field in the given form to the given value. For read-only form widgets and controls, the click may be recorded for use by submit, but the value is not changed unless the **config** command has changed the default behavior. See **config** and the section titled "Details on Form Handling" for more information on the **formvalue** command.

For list widgets, you can use one of the following commands to select or de-select a particular value. To select a value, enter the command in this format:

```
formvalue <formnum> <fieldname> +value
```

To de-select a value:

```
formvalue <formnum> <fieldname> -value
```

- **fv** - Abbreviation for the formvalue command.
- **formaction** <formnum> <action> - Change the form action URL to the given URL.
- **fa** - abbreviation for the fa command.
- **formclear** - Clear all values in the form.
- **formfile** <formspec> <fieldspec> <filename> [<content_type>]* - attach a file to a file upload button by filename.

A.6. Cookies

- **save_cookies** <filename> - Save the current cookie jar to a file.
- **load_cookies** <filename> - Replace the current cookie jar with the specified file contents.
- **clear_cookies** - Clear all of the current cookies.
- **show_cookies** - show all of the current cookies. Sometimes useful for debugging.

A.7. Debugging

debug <what> <level> - Turn on or off debugging/tracing for various functions.

Enter the command in the form:

```
debug <what> <level>
```

where <what> is one of these options:

- **HTTP** - Show HTTP headers.

- **equiv-refresh** - Test HTTP EQUIV-REFRESH headers.
- **twill** - Show twill commands.

and <level> is 0 (for off) or 1 (for on).

A.8. Other Commands

- **tidy_ok** - Check to see if the **tidy** command runs on this page without any errors or warnings.
- **exit** * [<code>]* - Exit with the given integer code, if specified. The value of <code> defaults to 0.
- **run** <command> - Execute the specified Python command.
- **run file** <file1> [<file2> ...]* - Execute the specified files.
- **agent** - Set the browser's "User-agent" string.
- **sleep** [<seconds>] - sleep the given number of seconds. Defaults to 1 second.
- **reset_browser** - Reset the browser.
- **extend_with** <module> - Import commands from the specified Python module. This acts like `from <module> import *` does in Python.

For example, a function `fun` in `ext module` would be available as `fun`. See *examples/extend_example.py* for an example.

- **add_auth** <realm> <uri> <user> <password> - Add HTTP Basic Authentication information for the given realm/URL combination.

For example, `add_auth IdyllStuff http://www.idyll.org/ titus test` tells twill that a request from the authentication realm "IdyllStuff" under `http://www.idyll.org/` should be answered with username 'titus', password 'test'. If the `'with_default_realm'` option is set to True, ignore 'realm'.

- **config** [<key> [<value>]] - Show/set configuration options.
- **add_extra_headers** <name> <value> - Add an extra HTTP header to each HTTP request.
- **show_extra_headers** - Show the headers being added to each HTTP request.
- **clear_extra_headers** - Clear the headers being added to each HTTP request.

A.9. Details on Form Handling

The **formvalue** (or **fv**) and **submit** commands rely on a certain amount of implicit cleverness to do their work. In odd situations, it is difficult to determine which form field **formvalue** will choose based on your field name, or which form and field **submit** is going to "click" on.

Example 1

Following is the pseudocode for how **formvalue** and **submit** determine which form to use (function `twill.commands.browser.get_form`):

for each form on page:

if supplied regexp pattern matches the form name, select

if no form name, try converting to an integer N & using N-1 as

an index into the list of forms on the page (for example, form 1 is

the first form on the page).

Example 2

Following is the pseudocode for how **formvalue** and **submit** determine which form field to use (function ``twill.commands.browser.get_form_field``):

search current form for control name with exact match to fieldname;

if single (unique) match, select.

if no match, convert fieldname into a number and use as an index, if possible.

if no match, search current form for control name with regexp match to fieldname;

if single (unique) match, select.

if **still** no match, look for exact matches to submit-button values.

if single (unique) match, select.

Example 3

Following is the pseudocode for ``submit``:

if a form was `_not_` previously selected by **formvalue**:

if there is only one form on the page, select it.

otherwise, fail.

if a field is not explicitly named:

if a submit button was "clicked" with **formvalue**, use it.

otherwise, use the first submit button on the form, if any.

otherwise:

find the field using the same rules as **formvalue**

finally, if a button has been picked, submit using it;

otherwise, submit without using a button

A.10. ZenWebTx Extensions to twill

ZenWebTx adds several commands to the standard twill vocabulary.

A.10.1. twilltiming

`twilltiming` sets timers in a set of twill commands. If you then define a data point for this timer, you can graph and set thresholds on this timer value.

Use the following command to start a new timer:

```
startTimer myTimerName
```

and then, to output the value:

```
printTimer myTimerName
```

Timer values should be output only once. So, to output the time from the start of the script to more than one point in the script, you must use more than one timer. For example:

```
startTimer wwwZenossCom
startTimer bothPages
go http://www.zenoss.com
printTimer wwwZenossCom
startTimer communityPage
follow "Community"
printTimer communityPage
printTimer bothPages
```

To use these timers in Resource Manager, create data points with the same name as the timers. In this example you could create data points named `wwwZenossCom`, `communityPage`, and `bothPages`. You can then use these data points in Resource Manager thresholds and graph definitions.

A.10.2. twillextract

`twillextract` extracts numeric values from Web pages during the transaction. To use `twillextract`, use the following command to match the given regular expression to the current page:

```
extract <dataName> <regularExpression>
```

The value 1 or 0 is assigned to `dataName` depending on whether the regular expression matched or not.

Additionally, you can use Python's regular expression substring-matching syntax to extract substrings of the matched text. For example, `http://www.zenoss.com` contains a copyright notice near the bottom that looks like "Copyright (c) 2005-2011 Zenoss, Inc." The following `twill` commands use a regular expression to grab the second year from that notice:

```
go http://www.zenoss.com
extract copyright "(?P<firstYear>[0-9]*)-(?P<secondYear>[0-9]*) Zenoss, Inc."
```

`(?P<name>....)` is Python syntax for naming that particular part of the regular expression. The value extracted from that part of the matching text is given the name from the `extract` command, then a dash, then the name from the sub-pattern. In this example, `copyright` gets a value of 1 or 0 depending on whether the pattern was found on the page or not, and `copyright-firstYear` and `copyright-secondYear` get the values extracted from the matched text. To use these values in Resource Manager you must create data points in the WebTx data source with the same name as those you used in the `extract` command. In this case you would create data points named `copyright`, `copyright-firstYear` and `copyright-secondYear`. You can then create graph definitions and thresholds for these data points.

A.10.3. twillxpathextract

Resource Manager uses the `twillxpathextract` command to extract numeric values from XML documents. To use `twillxpathextract`, add the following command to match and extract data using the given XPath expression:

```
xpathextract <dataName> <xpath>
```

where `xpathextract` is the command name, `<dataName>` is the name of the data point to which the value will map, and `<xpath>` is the xpath used to retrieve the data.

When applied to an XML document, the XPath expression must return a numeric value. This value is then assigned to the `dataName` data point.

A.10.4. ignorescripts

ignorescripts strips javascript from visited pages before they are processed by twill. Although twill ignores script tags, it is possible for scripts to include strings that twill will interpret as HTML tags. Including the command `extend_with ignorescripts` near the top of your twill commands will cause all script tags to be stripped, thereby avoiding this issue.
